Mr. A. G. Quibell's design is also "highly commended," although it hardly suggests a village club. The imposing elevation with its towers and buttresses is cleverly conceived, but quite unsuited to the site, or the purpose for which it was designed. The perspective is not on the same level as the other drawings, which are most effectively rendered. The plan is unnecessarily extravagant—a library, refreshment bar, and scenery entrance, for example, can easily be dispensed with when £1500 is all the money at the architect's disposal.

For some reason we cannot understand, Mr. Heatham is "highly commended" for his set of drawings. The irregularity of the plan is caused by an unnecessary amount of passage-way, a fault which is conspicuously absent in

have adopted, would always be most inconvenient, and in the case of panic very unsafe.

Mr. Hampden W. Pratt contributes a design which seems to be a combination between a suburban villa, an incongruous tower, and a poverty-stricken chapel. The plan is, however, a good one, were it not conceived on too large a scale.

Mr. Robert Clamp sends in a domestic design with a very extravagant plan. Why he should have troubled to illustrate a quite ordinary staircase with an ill-drawn sketch, when he contributes a very nice pen and ink exterior perspective, it is difficult to imagine.

Mr. Stonhold's design has the merit of looking like a public building, and is seen to advantage in a well-coloured perspective. The plan, however, is ill-arranged, all the accommodation being on the same level, with the hall at the back of the club.

Mr. Varndell's set of drawings are interesting from a pictorial point of view, the mediæval perspectives being cleverly drawn, but it is difficult to take this design seriously.

Although some of the remaining designs possess merit, they do not call for any special criticism.

BYFLEET COMPETITION.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

December 29th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE award in the Newark School of Art and Technical Buildings competition has been made by Mr. Ernest George, who placed the designs as follows: First premium (£50), Messrs. C. E. Mallows and Grocock, Bedford and London; second premium (£25), Messrs. Silcock and Reay, Bath. The work of erecting the building will be placed with the successful architects, and will be commenced at an early date.

WE hear that Mr. Aston Webb, F.S.A., F.R.I.B.A., has been appointed by the Corporation of Nottingham to assess the designs sent in competition for the new cemetery at Basford. Mr. H. E. Milner, F.L.S., A.M.I.C.E., will assist in the adjudication of the schemes for laying out the grounds. We also learn that twenty sets of drawings have been received. It is interesting to note that the Corporation intend building a crematorium, designed on the latest and most approved principles. It is to be hoped that before long all the large towns will be provided with this most necessary adjunct to a cemetery.

A CORRESPONDENT writes:—"I wonder how many students and artists are aware that there is a very fine specimen of mural decora-

tion to be seen at University College, Gower Street. The work is in marble and coloured cements; and was bequeathed to the college by Mr. Grote, the historian. I may mention, by-the-way, that more than once £35,000 has been offered for the work by Americans who would like to take it across the water. Yet I seldom or ever see a Fine Art student paying any attention to the work, which, I may mention, is well placed for study, being admirably lighted."

"I WISH also to draw the attention of art students," continues our correspondent, "to the fact that, though there is no mention made of it outside the lodge gates, or on the notice board, there is a very excellent collection of plaster casts contained in the Flaxman Gallery, together with many pencil and other drawings by the master himself, which are daily open to the public, gratis, from 10.30 a.m. to 4.30 p.m. I venture to think if greater use were made of the gallery and its contents, it would be to the manifest improvement of students; also the collection, which I found

exceedingly dirty and dusty, on remarking which I was told by an attendant that the casts had not been cleaned for ten years, while he also told me that the principal visitors were Americans, and that he seldom or never had a Fine Art or Slade scholar in the gallery—in fact, he believed many of them did not know it was there. As this collection comprises such works of art as replicas of the Achille's shield, a recumbent monument in St. John's, Manchester, and the colossal group of the Angel Gabriel overcoming Satan—the original of which is at Petworth Castle—I think it would be well if the authorities of the college took some means of making the gallery better known, and of providing a catalogue for the use of visitors, or, better still, labelling the works. It is a poor appreciation of Miss Denman's generosity that the Flaxman Gallery is deserted as it is. In the meantime, it would be well to have the exhibits cleaned, and then our budding sculptors could study the many beautiful bits to be seen there."

It may not be generally known (says a correspondent) that one of the schemes which was laid before the Government Committee which has been considering the question of new sites for the War Office and other departmental buildings, contained proposals of a no less revolutionary character than the erection of a huge monumental group in commemoration of the Diamond Jubilee on the site of King Charles statue, and the general re-arrangement of the Nelson column, the Gordon statue, and other familiar memorials in the square of squares. Briefly stated, the idea was to widen Charing Cross to 100ft., and to make an axial line from King Charles statue, which would be shifted back to the site of the Nelson column, radiating in the direction of Northumberland Avenue, Charing Cross, the Strand, Cockspur Street, and the Mall. The Nelson monument would be set back nearer to the National Gallery, and immediately between the two fountains, whilst beyond this was to be placed the Gordon statue. The result of these proposals, if carried out, would be a large addition to the roadway at Charing Cross, whilst anyone standing at the central axis already mentioned, would have an uninterrupted view down these five main arteries of traffic, and in the case of the Mall, when Spring Gardens was opened up, into the very park itself.

A DISCOVERY of great interest to archaeologists has been made at Tasburgh, in Norfolk. The village is the reputed site of a Roman camp, and occasional remains have been dis-

BYFLEET COMPETITION.

interred there. The new discovery is the burial-place of the victims of what was evidently a considerable battle. In one small pit, only a few yards square, forty skulls were found, as if the dead had been thrown in in heaps, and at other points in the neighbourhood excavations following on the first discovery have revealed others. The place was evidently a veritable ancient Golgotha. Mr. Walter Rye, the well-known East Anglian archaeologist, is in charge of the excavations.

THE Chancellor of the Diocese of Peterborough (Mr. G. H. Blakesley) has heard, at Northampton, the petition of the vicar and churchwardens of Towcester for a faculty empowering them to remove the east window in the parish church and to substitute, as a memorial of the Queen's Diamond Jubilee, one which has been purchased at a cost of £320. The application was opposed by Major Price Blackwood on behalf of a large number of ratepayers, on the ground that the meeting which decided on the new proposal was illegal, and that the present east window was a memorial one placed there sixty years ago. After a hearing lasting six hours the faculty was refused.

At a recent business meeting of the R.I.B.A. Mr. W. Woodward called attention to the proposal of the London County Council to seek Parliamentary powers to amend the London Building Act (1894). He made suggestions for the opinions of members of the Institute on the subject to be represented to the County Council, and the Chairman promised to lay the matter before the Institute's Council.

To build a villa on property the mere ground rent of which is £3000 a year is a feat of extravagance which could only be achieved by the modern millionaire; and now that Barney Barnato's mansion has passed into the safe hands of Sir Edward Sassoon, Mr. Belt's new house is the most sensational one in Park Lane. At first sight it looks more like a villa on the Thames than a mansion in one of the most fashionable thoroughfares in town; but it is stated that the secret of its Architecture lies in the fact that the Duke of Westminster would not allow a house of the ordinary height to be built on that site. The rooms of the house are oddly arranged, all the rooms on the ground floor being evidently built with an idea of receptions, while the chief beauty is the winter garden, which is really a forest of green, with any amount of water to supply the fountain. Upstairs the suites of rooms are somewhat suggestive of flats.

THE London County Council has had under consideration the Fire Brigade Committee's recommendation that certain work in enlarging and altering the Hampstead fire station should be entrusted to the Works Department, at an estimated cost of £4900. This matter has several times been before the Council. Some weeks since tenders were invited for the work, and the lowest being so largely in excess of the architect's estimate, it was decided by the Council to accept none of them. An amendment to the proposal, that the committee be instructed to advertise for tenders, was carried.

MR. THOMAS ROSS recently lectured on "The Minor Churches of Scotland," in the Song School of St. Mary's Cathedral, Edinburgh. He remarked at the outset on the great activity in church building during the twelfth century, when the Norman style prevailed, and showed that there are about seventy sites in Scotland where there are traces of Norman work. In some instances these are very slight, consisting of a few scraps of chevron ornament, as at Ormiston and Forgandenny; at others of tolerably complete churches, as at Leuchars and Dalmeny. These two churches, with the fragment at Tynningham, were shown to belong to the same period of the fully developed Norman Architecture, the latter being probably the richest example of the style in Scotland. It was observed that the square east end prevailed over the apsidal

east end, as indicated by the remains, in the ratio of about three to one, and that there are still standing, either wholly or in part, some fifteen or twenty chancel arches. Those at the churches just named, and at Legerwood, Duddingston, St. Blane's, Birnie, Gullane, and Buncle, were described—the latter, from its extreme simplicity, being probably of very early date. Various other specimens of the style were alluded to, such as Muthill, Dunning, Monymusk, Peterhead, Edrom, and Stobo. Passing on to the next century, it was seen that most of the great cathedrals and abbeys were then in progress, and these absorbing most of the wealth and labour of the country, fewer minor churches were erected than in the previous period, and that generally they were of a very plain and simple design as compared with the Norman churches.

THE churches at Airth, Kirkliston, and Bathgate are examples of transition work, and at Dunstaffnage, Skipness, and Killeen in the west there are fine examples of early Gothic work. Especially may the first-named be regarded as one of the most beautiful early Gothic churches in Scotland. In the east, at Pencaitland, Prestonkirk, Luffness, and Upper Keith, there remain fragments more or less complete, showing the Architecture of the period, and in other parts of the country, as at Auchendoir, Altire, Rattrayhead, Culross, Farlane, and Prestwick, are to be found other examples, all generally in a very ruinous condition. During the fourteenth century there was a cessation from church building to any great extent, till towards its close a revival began, and henceforward the ecclesiastical Architecture of Scotland assumed a nationality which continued to characterise it till the seventeenth century. This in a large measure arose from the action of castle building on church building. Examples of the latter style are very numerous, and often fairly well preserved, in part at least, many of the best specimens being those known as the Collegiate Churches, of which between thirty and forty were built between the end of the fourteenth century up to within a few years of the Reformation; only a few of these churches were ever completed, most of them wanting the nave. At Dunglas, Biggar, Tullibardine, Innerpeffray, and Foulis Easter we have examples of this class in a completed state, and still standing, all of them containing features of great interest and beauty, Foulis being remarkable for Scotland in the possession of three large paintings of pre-Reformation date. It was shown that many of the churches of this period in their interiors bore a great resemblance to the halls in the castles, such as Queensferry and Yester, and that at a later time the same kind of details were used in both, as at Stobhall, where the church and the turreted mansion are combined in the same style. This church at Stobhall is of peculiar interest as still retaining many of its original features, which were so generally destroyed as being considered monuments of idolatry.

THE Guildhall enquiry re the Cripplegate fire has been adjourned until January 4th. One of the last witnesses called was Mr. J. W. Penfold, architect to the Goldsmiths' Company, the freeholders of the Cripplegate Estate, who, questioned as to whether he agreed that the erection of fireproof buildings in place of those destroyed would cost 50 per cent. more, replied that it all depended upon the degree to which the buildings were fireproof. The Company would never think of building a warehouse in the way Winchester House was constructed, as the cost would be too much and the rent more than the people would be able to pay. He thought a reasonable suggestion was that the different stories should be isolated by concrete floors. If that were done the probability was that in the case of a building becoming ignited by a fire on the adjoining premises, the flames would not spread below the top concrete floor.

WHILE digging operations were going on at Maiden Cross, Hexham, a large and curious stone was found. This has been examined by Mr. C. C. Hodges, architect, and he thinks it is

as early as the fourteenth or, perhaps, the thirteenth century, and that it is the base stone of the western sanctuary cross which stood on or near the site of the house at Maiden Cross. The base of the eastern sanctuary cross has long been preserved in the yard at the Union Workhouse, and that of the northern cross is still on the top of the Cross Bank. The southern cross was on the top of the Gallows Bank. These four crosses marked the outer boundaries of the privileged area, and were placed on the main roads into the town. The large stone found is very well cut, and has been used in late times to form a "creeing" trough, and to this fact it, no doubt, owes its preservation.

WE hear on credible authority that Mr. E. Ingress Bell is retiring from the War Office. It is a fact that Mr. Ingress Bell has of late been very considerably engaged in private practice in association with Mr. Aston Webb.

THE Metropolitan Music Hall in Edgware Road stands upon the site of the old "White Lion," which was built in 1524. The music hall, however, was not built until 1862, and now appears in a glorified form, after being closed since March last. Sir Thomas Fardell, L.C.C., and Mr. John Aird laid the foundation stone of the reconstructed Theatre of Varieties in August last, since when the present building has rapidly taken shape. Mr. Frank Matcham is the architect, and the plans have received the sanction of the County Council. Every part of the house is of fireproof construction, and in addition to nine separate entrances and exits and to the requisite fire appliances, a safety curtain of iron and asbestos completely isolates the stage from the auditorium. The exterior is in granite and Mansfield stone, of a light terra-cotta colour, with lofty minarets.

At a meeting of the Socratic Society, Mr. F. A. C. Morrison read an interesting paper on the application of colour to sculpture among the Greeks. He gave a very clear account of the practice of colouring both buildings and statuary in all periods of Greek Art, and said that the modern aversion to coloured marble was due to some extent to a misconception. In the early stage, no doubt, the Greeks used colour to conceal the deficiencies of the chisel; but in the fifth century the effect of colour was to heighten the beauty and to bring out the characteristic features of works of art.

"HUMOUR in Art" was the title of a lecture given in connection with the Storey Institute series, Lancaster, by Mr. J. F. O'Hea. The lecturer referred to the severity of the earliest art, and then pointed out that the Greek must have his humour, so he invented the series of hideous masks which used to be worn at their religious festivals. That gave origin to the form of play called masks, which were popular at the time of Elizabeth. The Greek was robbed of his mask by the Roman, and the Roman by the barbarian, who, himself turning artist, gave us the fine specimens of Gothic Architecture which adorn our cathedrals. Two of the earliest specimens of caricature in art were found beneath the seats in the stalls in the cathedrals of Limoges and Strasburg—one represented a prominent preacher as a dog teaching fowls that to be easily cooked they should not grow feathers. The Renaissance brought forth a crowd of artists who devoted themselves to humour. He gave types of caricature by Hogarth, Rowlandson, Gillray, one by Rowlandson representing two doctors debating, while Death came and wrote the last prescription. Hogarth was undoubtedly, the greatest humorist, moralist, and satirist of any time or clime. He had had numberless imitators, who came a long way after him.

THE City Commissioners of Sewers have laid before the Improvements Committee of the L.C.C. plans showing proposals for the formation of a new east and west thoroughfare directly connecting London Wall with Smithfield, and passing through the district affected by the recent great fire, and also of a new

street passing from Redcross Street to Falcon Street by way of Hamsell Street. In the opinion of the Improvements Committee, these proposals do not provide for such a rearrangement of the narrow streets on the area affected by the fire as would prevent the recurrence of a great conflagration, and the proposals therefore in their present form do not commend themselves to the Committee, who have accordingly informed the Commissioners that any improvement to be actually undertaken should provide primarily for the lessening of danger by fire in the district in question.

ANOTHER of the County Council's undertakings will, it is probable, make a practical move early in the new year. That is the new housing scheme on the ground at the back of the new Gallery of British Art. The start has been delayed by the necessity for overhauling the estimates of cost since the plans were first made. There has been an advance in wages and the cost of material sufficient to make all the difference between a paying and losing scheme, and some re-adjustments have had to be effected. That has now been done, and the work may be commenced with little further delay. It will afford first-rate dwellings of their kind for about 4300 persons.

ON the front page of this number we reproduce a sketch of a roof screen from Atherington Church. The sketch shows the whole screen, about 18ft. from the ground. The screen has been described in the transactions of the Devon Architectural Society as the most magnificent specimen of carved screen-work in the county of Devon, which, of course, is famed for its lovely screens of the Perpendicular period.

THE theatre at Shoreditch has been reconstructed. The auditorium is now one of the largest in London, being about 70ft. square, and has been treated as a three-tier house. On the ground floor are orchestra stalls, pit stalls, and pit; on the first tier the grand and family circles; on the second tier, the balcony, and on the third the gallery. The construction is entirely of concrete and steel, and, in spite of the great width (about 70ft.), only two light steel shafts are used, thus ensuring an uninterrupted view of the stage. The decorations are late Italian Renaissance, and the domed ceiling, one of the largest in England, being over 50ft. in diameter, has been specially designed and executed by a Parisian artist, the subjects being the Drama, Opera, Music, and Literature. Over the proscenium opening is another large panel by the same artist, being the Glorification of the World by Tragedy and Comedy. Mr. Crewe, the architect, has made a special endeavour to provide that the electric lighting shall form an absolutely integral part of the decoration, which result has been obtained by decorator and electrician working absolutely together under the direction of the architect. The scheme of colour throughout is ivory and cream, relieved by gold and copper, and the upholstery and hangings are in Florentine red. Besides a grand saloon, there are spacious and handsomely-decorated saloons for orchestra stalls, pit stalls, pit, balcony, and gallery, and separate retiring rooms on each tier.

SPEAKING at Hammersmith on the mosaics at St. Paul's Cathedral, Sir W. B. Richmond, R.A., said that Wren intended all the flat and curved spaces to be covered with mosaics, but funds were wanting. Coming to his own work Sir William said his proposal to employ English workmen on the mosaics left the committee somewhat aghast. But he thought that English workmen ought to be employed to decorate the great mother-church of their country, and he determined to train his own workmen to work under and with him. He would say to anyone engaged in artistic work that unless he kept in absolute touch and sympathy with his workmen and treated them as brother artists, he would get no good work

done. Of his workmen, whom he could call his friends, not one had left him. In a shed attached to his house, about six of them began to work and went on for six months from eight in the morning to six in the evening, and during that time finished the two, big spandrels now up in St. Paul's. This method was very expensive. They then started on the wall itself. After describing the method of work, Sir W. B. Richmond remarked that he thought they had in England as good a school of draughtsmen as the world could produce or had produced. His workmen had shown extraordinary intelligence in following out what he had taught them, and the artistic spirit they had developed enabled them to modify the colours in the designs according to the light in which the mosaic was placed.

THE third of Lord Rowton's series of "Poor Man's Hotels" is now finished at Newington Butts. The first house, situated at Vauxhall, has 475 cubicles; the second, in King's Cross Road, accommodates 677 lodgers; and the new premises will sleep 805. The site of the latest house is within a few yards of Newington Butts, and has its entire frontage on a public recreation ground which was formerly the churchyard of St. Mary, Newington. In all the important details of construction the principle adopted at Vauxhall and King's Cross has been followed, experience having proved the soundness and convenience of the original system. The sanitary, lighting, and fireproof provisions are on the most perfect scale, and the comfort of the lodgers has been provided for with the forethought that is founded on an intimate practical acquaintance with their needs. A fourth "Rowton House" is in course of erection in Hammersmith, and a fifth is being arranged for in Whitechapel.

WHEN the Jubilee procession passed Hyde Park Corner permission was then granted to the park-keepers to erect a stand between the railings and the lodge on the west side of the entrance. In so doing they evidently narrowly escaped the bringing about of a very serious catastrophe, for they pushed the heavy pillars and railings considerably out of the perpendicular, and had these fallen on the crowd below many lives must have been lost. The country has presumably to pay for setting right this bad construction, and judging by the time which it has taken, the bill will be a heavy one; for to rebuild these few yards of paling not only has large scaffolding been erected, but four months at least have been spent on replacing the pillars, and it looks as if it might last another four. It is against this gross dilatoriness that every one who concerns himself with the picturesqueness of our public places must protest.

THE first span of the large iron curtain which separates the stage from the auditorium at Olympia has been successfully swung into its place. The width of the proscenium is 460ft. In order to make a fireproof screen across this space, two steel towers, each 90ft. high, have been erected at a distance of 110ft. from either wall. To sustain the iron curtain, which runs in a groove let into the sides of the towers, two steel spans, each of which is 240ft. long, 45ft. high, and weighs 35 tons apiece, are necessary.

A LOCAL architect (says the Western Mail) went to the trouble and expense of preparing plans for the new Town Hall and Law Courts at Cardiff and then forgot to send them in. The same authority adds that in one of the plans for a new Town Hall for Cardiff the internal arrangements were in such a shape that it would have taken one of the borough engineer's clerks about three hours to find one of his assistants.

THE old-fashioned whitewashed and red-roofed hostelry at Putney, known as the Old Crab Tree, will shortly disappear. The place is found to be quite inadequate for modern requirements, and it is to be demolished within

the next few weeks to make way for a more elaborate and handsome building now in course of construction. The present building has stood for some 400 years, and has outlived the small village of Crab Tree which formerly stood round about it. The chief interest of the Crab Tree lies in its cellars. There can be seen to this day the commencement of a passage which formerly led into the river, into which, so tradition has it, contraband goods were dropped from boats in order that they might, at a convenient time, be dragged into the tavern. A mysterious chimney, too, leads one to imagine the former existence here of an illicit still.

THE Board of Inquiry into the cause of the extensive fire at Dover Castle, after taking evidence, inspected the chimney stack in the vicinity of which the fire broke out. It was taken down in their presence, and it was then found that the flue linings were all damaged, and in some cases smashed, while the brick and stonework was very defective. The experts advised the Board that bad material had been used in its construction, and there was no doubt that the fire was due to these defects.

THE dwarf screen in Probus Church has been extended as high as the capitals of the pillars. The existing work was constructed by the late Mr. Street, when the church was restored in the year 1851, and is composed mainly of old oak carved bench-ends, with modern circular tracery panels, and moulded capping over, and of the remains of the door and other posts of an ancient screen. The date 1591 is on one of the panels. Mr. Street's work has been left untouched. The addition, to the height of 8ft. above the old work, consists of three bays on each side of the doorway, with heads of tracery and carving of perpendicular character and varied design, a tracery head of similar character in the doorway, and a beam or cornice richly carved, and surmounted by bradishing. The whole of the work is in the best English oak. The total height of the screen as completed is 12ft. 3in. from the chancel floor.

IN connection with the Edinburgh School of Applied Art, an exhibition of work by the students has just been held in the Royal Scottish Academy Galleries. A number of the drawings were architectural studies from Kirkcaldy, Dunfermline, Dysart, &c., along with reproductions of ironwork and old furniture. In the second octagon there was a very interesting collection of drawings of a varied nature by two of the students who had been engaged in a sort of art survey of the old buildings in and around Edinburgh. When anything quaint or interesting was found in Architecture, metal work, or furniture a copy was made for preservation in the portfolios of the school. A large amount of excellent material has already been secured, which, but for this survey, would have been lost to Art, as many of the old buildings are in process of demolition or reconstruction.

THE A. and P. Roberts Company, operating the Pencoyd Ironworks, it is stated, has received a cablegram from Utrecht, stating that the Company's bid of £94,000 is the lowest in the competition for the contract for the material and erection of an extensive steel bridge over the River Yssel, near Westervoort, Netherlands. The bridge is to be built for the Government of Holland. The Pencoyd Company has not yet been advised whether the bid has been accepted, but Percival Roberts, in speaking of the matter, said that even if it was not awarded the contract, he was pleased to know that the Company's figures were lower than those of the foreign competitors. The cablegram informed Mr. Roberts that the next lowest bid was £97,000. The Company has just closed a contract for about four thousand tons of iron bridge material for the Imperial Railroad of Japan, which is owned and controlled by the Japanese Government. The material is for the construction of smaller bridges on the line of the railroad.

THE ARCHITECTURE OF THE RENAISSANCE.

By PROFESSOR AITCHISON, A.R.A.

LECTURING before the Architectural Association of Ireland on "The Architecture of the Renaissance," Professor Aitchison, A.R.A., said the interest in Renaissance Architecture was of an entirely different kind from that which enthralled them in Gothic. The men of the Renaissance were actuated by entirely different desires from those of the middle ages, and were also of most vigorous physical and intellectual powers, but were by no means so overflowing in invention, and the architects were absorbed by a new desire of giving the simplicity and design of classical Architecture to their own architectural works, and, being mostly artists, they wanted to make

STRIKING PICTURES OF THEIR BUILDINGS

in architectural language, and they were by no means troubled with any desire for feats of construction, for they were not constructors, and had Roman authority for massiveness. They had, however, a love of beauty that has been exceeded only by the Greeks. He did not think the Italian architects ever quite equalled in their works the dignity and impressiveness of Roman buildings, though there was this to be said in favour of them, they had only a part of the revenues of a great nobleman, or a great city, to expend, while the Romans had a part of the plunder and taxation of the civilised world. It was, perhaps, unfair to judge of what the Romans could do from the trifling remains that were left, but he recollected nothing of them that possessed that exquisite-ness of some of the best early Renaissance buildings, not to speak of the semi-architectural monuments of the Renaissance. He might, however, say that for style and beauty the Renaissance still held its own, and showed its visual superiority over every sort of work that had been done since the

PALMY DAYS OF ATHENS.

There was a long list of architects of the fifteenth century—from Bendetto da Majano to Michel Angelo—of whom, perhaps, Peruzzi and Bramante were the greatest, but these early Renaissance men were so full of energy and capacity that they could turn their hands with success to almost anything. One had but to read the account that Leonardo da Vinci gave to Sforza of what he could do, and the life of Benvenuto Cellini, to see that these men could sing you a song, or make you verses, build a ship or lead an army, paint a picture, cast a statue, or engrave a die with almost equal felicity and success. There was a native vigour about their minds and an inventiveness which rendered their work more interesting to us than when the whole of Roman Architecture had been measured and mapped out, as it were, by the middle of the sixteenth century. Buildings could then be made by recipe, and could be criticised by their supposed exact similitude to ancient Roman work. The Architecture of the fifteenth century was done by men who still retained memories of a former style and of former austerity, and had been spurred to invention by the first

SIGHT OF ROMAN MODELS.

The Palazzo del Consiglio at Verona—attributed both to Fra Giocondo and Formentone—the Communal Palace at Brescia, the Church of the Madonna dei Muracoli at the same town, the Scuola de St. Marco, and the Palazzo Corrado-Spinelli and the Manzoni at Venice, and some of the more striking tombs, would do more to raise their admiration for these lovely works than a long list of more pretentious and duller works; although Palladio's great hall at Vicenza, Peruzzi's Palace at Rome, and Michel Angelo's staircase at the Laurentian Library, and his chapel to the Medici should not be omitted, nor some of the lovely works of Bramante; in fact, there was hardly a town in Italy that had not got some masterpieces of the early Renaissance, for it was the mingling of Christian truths

with Pagan myths that gave it one of its charms. The lecturer next gave an interesting description of the Corrado-Spinelli Palace at Venice, which, although small, was of very artistic device, and was supposed to have been designed by one of the Lombardi—a family which had produced as many architects as that of the Du Cerceau in France. This palace, although a jewel in itself, would, but for its artistic perfection, be almost unobserved by the side of the gigantic Palazzo Vendramin and other large palaces on the Grand Canal. There was another small but most charming palace, which Browning once bought, rather later than the Palazzo Spinelli. The lecturer next said a few words on the quaint inventiveness of these early Renaissance men, and, proceeding, described the two palaces built by Baldassarre Peruzzi for the Marquis Messini in the Via San Pantaleone, the great charms of which were their plainness and elegant proportions. The lecturer then dealt with the works of Palladio, who conveyed the grandeur of expression of the antique. His basilica at Vicenza was one of his most impressive works. The Italian Renaissance came about by a triple influence—patriotism, intellectual freedom, and taste. Italy, torn by faction or ground under the feet of execrable tyrants, loved to see buildings that reminded her of Italy's greatness. She hated to see a style that reminded her of ecclesiastical fetters and austerity, while the cultivation so earnestly pursued for more than a century made her long for dignity, grandeur, simplicity, and breadth of ecclesiastical buildings. The lecturer, proceeding, said he had dealt with the four epochs of Architecture beginning from the time of the Greeks. Each period showed the peculiar genius of the people, and their progress in intellectual development. It was true he had only given a glimpse of the perfection of Greek Architecture, of the dignity and magnificence of Roman, of the

SOARING FLIGHTS OF GOTHIC,

both constructively and æsthetically, and of the greater perfection and artistic beauty of the revived Roman; but he hoped he had whetted their appetite to know more about Architecture, and to take more interest in that of the present day. It was from the numbers, knowledge, and taste of the lovers of every art that its perfectness developed. They could not believe that if the public generally were as dead to the flights and perfection of poetry as they were to Architecture, they should ever have had Tennyson. Did they think painting would have flourished as it did in Italy if the painters had not recognised the love of the people for it, and had not recollected the Cimabue who made the first step forward from the old Byzantine mechanism had not had its picture borne in triumph through his ward, and that it was ever afterwards called the Joyous Ward. They must remember that Architecture alone of all the fine arts told the history of the cultivation of the people, at the time it was done in its own country, while the works of every other fine art could be and were exported. They should remember the boast of Pericles to the Athenians, "We love the beautiful." If they did not love it nowadays how could they expect to rival those who did? He hoped that the imperfect description he had given of the great progress that had taken place in old times would have some effect in making his hearers see for themselves the glorious beauties of continental Architecture during the periods he had dealt with. The lecturer, in conclusion, said much as he desired the Architecture of the Renaissance, he must admit that the architects of those days were not constructors as were the architects of the middle ages. They were painters and sculptors, and they painted their architectural designs, as it were. He urged on those present to spare no pains and no effort to become masters of their Profession. The poets had set them an example in this respect. Let them consider Milton, and how Longfellow translated the Italian poet in order that he might thoroughly study their style.—Professor Aitchison exhibited a very large collection of photographs, which formed a unique record of the period of the Renaissance.

HOUSE DECORATION.*

By L. A. SHUFFREY.

(Continued from page 440.)

WALL surfaces should be squared up; a narrow slip of paper over door or window architraves is best got rid of, also the long spandrel piece over an arch. It is better to break it forward with a vertical line and break the cornice over it. Sofits of arches should not be left plain as ceiling, but should be treated with the same material, or to look the same as arched mould. These are points which cannot well be carried out unless done at the time of building. I have often had to ornament a ceiling where all the mouldings have had to be suspended, as it were, from the ceiling on account of the fixed position of the cornice. In low rooms the plan of treating the whole chimney-breast as a feature, instead of applying the chimney-piece, is a good one.

DINING-ROOM.

The division of the wall space in this room might conveniently be done by a wood skirting, plain face and rail, to a height of 2ft. 9in. (pictures could then, if of large size, occupy the space up to the frieze rail), the cornice, frieze, and rail, grooved for picture hooks, being one composition. The heavy Early Georgian type of cornice and dado always appears to suit a dining-room. If it gets the morning sun the main filling of the walls might be a wall-paper two tones of deep green, the ground being warm in tone, with a lighter and colder print; the paint a golden green, and the flat of dado a deep rich red, inclining to crimson; cornice and frieze tones of citrine, and the ceiling a still lighter tone. If the owner of the house has any oil paintings they are likely to be hung in this room, and the question of the best background colour has to be considered. This may very well be studied in the public galleries which we have access to, and that used in the entrance-hall of the National Gallery appears to me the most satisfactory. It is a flock paper printed in two tones of a mellow, dark green, inclining to olive. It is there very pleasantly contrasted with dull red marble columns. Both the colour and texture contrast well with the oil paintings, and give the very greatest value to them. There are other colours adopted, including red, which, I believe, is generally considered a good oil picture background, but none appear to me so satisfactory as this. At South Kensington a dark neutral green wall-paper of Morris's is very much used, but it appears to me too cold or grey for the purpose. The question whether the cornice of a room should be treated dark, similar to the paint or light like the ceiling, is always cropping up, and although it is rather trying to darken some nice plaster work, which looks so fair in its natural white, I consider it should be treated with the walls, not necessarily so dark, but sufficiently so to prevent the sudden contrast from dark to light just below the cornice.

THE DRAWING-ROOM.

The decoration of this room, of all others, should be bright and cheerful, and should light up well. Here, light or white paint is in place. For this room the mistress of the house must be consulted, and the various parts thought out with furniture hangings and carpets, to make the picture complete when furnished and occupied. Should the lady be a brunette, a cream paint and walls of a yellow tone may be suitable; if a blonde, a bluish grey or grey-green. The architectural panelling out of the walls of a room is but little practised now, although nothing gives such size and dignity to an apartment, whether by framing with large panels or by painted styles and rails. The tendency of late has been to ignore symmetry, and to indulge in corners and recesses, and small windows in odd places, by which a certain picturesqueness is obtained, but unbecoming cross-lights are developed, and a mere prettiness without dignity is the

* A paper read before the Architectural Association on Friday, December 17th.

result. There is little fear of stiffness in a drawing-room, as when the furniture and upholstery come, the severe lines of an architectural treatment of the walls will be pleasantly contrasted.

LIBRARY.

In this room a quiet, restful tone of colour should be aimed at, bearing in mind that books are the best ornamentation of the room, and choosing colours which will give value to their bindings. The fittings are best of hardwood, and, as it is inconvenient to reach books higher than about 7ft. 6in., this should be regulated to the height of them. A rail at this level (grooved for picture hooks) may be conveniently carried round the room where the bookcases do not occur. A fairly strong green is, in my opinion, the best to show off bindings, and this may cover the space above the bookcases, with a deep vellum coloured cornice and ceiling. The floor should be felted all over. In decorative work it seems to me to be very important to get rid of all boards.

BEDROOMS.

The deep frieze treatment for these is generally most convenient, and the chief characteristic of the colouring should be freshness. Here white paint, which in sitting-rooms makes the furniture, hangings, and carpets look dirty, is in place, and should be the standard of cleanliness and freshness generally in the room. The space above the picture rail looks quite well in plain distemper, but may have a running frieze in colours with good effect. In the ceiling I would plead for a little ornamentation to relieve the absolute blankness, which is so very general. Colour is too subtle and indefinite to talk about with advantage. It is relative; there is no such thing as a bad colour when regarded alone, as there may be a situation where that particular colour would be the best in combination with others for its position. A parti-coloured suit will keep fresh longer than a suit of one colour, and the same holds good in decoration.

CONTRASTING COLOURS

enhance the value of one another, and it is quite possible, by altering one colour in a decorated wall or ceiling, to give freshness to the whole, which before may have looked dirty and worn out. The coloured decoration of a room should be the conception of one mind, and the plan I advise is to make your scale sketch and stick to it as you would to your scale drawings in a building. I am well aware that in practice this cannot always be carried out, and it comes to doing the best you can under the circumstances, and if your lady client has set her heart upon shrimp-pink or hedge-sparrow-egg-blue for her drawing-room, then do the best you can to make a satisfactory combination in which those colours predominate. What I should like to impress upon all who are not in the habit of doing so is that a constant study of colour brings great enjoyment with it. The critical faculty can be used everywhere. As you study old buildings to improve your sense of form and proportion, study natural objects for improving your colour surface. The most unlovely object if left alone will be covered by Nature with the most beautiful colours, and the book is open for our delight.—The President said

IN DESIGNING BEAUTIFUL HOUSES

they had not the opportunity of decorating them at the time they were built. They wanted a scheme of colour-decoration before them when building a house. In the decorative work they were all apt to consider each room separately, and not a general scheme for the whole house. They found their clients wanted different colours, and it was rather an awkward point to deal with, altogether upsetting their idea for carrying out some general harmonious scheme for the decoration of the whole house. There was one question they had to face nowadays which gave them an advantage, and that was the use of electric light as a means of artificial decoration. Its advantage over gas was that they could use the same colour and get the same effect by daylight as by night light. He thought

THE TREATMENT OF CEILINGS

and walls had of late years been somewhat overdone by the enormous quantity of raised and other ornamental materials in the market. Especially were ceilings subject to this tendency. He was not advocating a plain ceiling, because he thought some of the treatment by these raised materials was most effective. If they had an ornamental ceiling it was best to have a plain treatment of the walls, and the reverse, a plain ceiling if they had ornamental walls. With regard to varnishing surfaces, he had always found it difficult to get painters to finish with a coat of varnish in consequence of the contended difficulty in working it. Of course it had a different effect, and he agreed with the lecturer that what they wanted was a dull and not a bright effect given by varnish. In dealing with old buildings, if they had a room of bad proportions they could very materially improve those proportions by the colour and the way in which the walls were divided up. If, as Mr. Shuffrey suggested, the architect had to consider the complexion of his client's wife and the ladies of the house, it would be adding one more difficulty to

A CHERISHED SCHEME OF DECORATION.

—Mr. Cole Adams, proposing a vote of thanks to Mr. Shuffrey, mentioned that his experience of the use of Stockholm tar for outside timbers was that it was ultimately affected by the sun. He recommended as a remedy the use of Brunswick black thinned down by turpentine as required. It was a fast colour, and he had used it on a garden house, where it had been preserved for four years. He agreed with Mr. Shuffrey about painting cement, which looked very nice. He did not know anything more distressing than cracked ceilings. He had seen speculative houses built fifty years ago, when speculative building was good, in which there was hardly a cracked ceiling. Probably that was because in plastering the men understood the trade better than was the case nowadays. As to wall papers great value would be got out of the ordinary brown paper. For a wall space or dwarf dado it was most useful, was very durable and clean, and would last a long time without showing the dirt. The speaker urged that it would be impossible to consider the complexion of the client's wife because they would have to consider that of the visitors as well. They must consider all classes when doing decorative work. For a drawing-room he did not think there was anything to equal

SOME SHADE OF YELLOW.

—Mr. W. Millard seconded the proposition. He said he knew it was not the rule, but he would have liked to see a specimen amongst those exhibited of the cornice made darker than the wall. With reference to patterns one really got wearied with them. He had often thought that it would be a grand move if they could decorate a house by themselves without having any patterns at all. A decorator told him that the first thing he did was to find out what kind of furniture the people possessed, and worked up a scheme of decoration from that. He (the speaker) was inclined to think that the modern idea of decoration was rather overdone, and that it was a question whether they should not consider what they would leave out. In fact, he thought sometimes there was a great deal in the art of seeing what they could omit.—Mr. Shuffrey briefly replied.

At the commencement of the meeting at which Mr. Shuffrey's paper was read the President proposed a vote of condolence with the family of the late Mr. J. L. Pearson, R.A. He said all of them had followed the splendid works of so great a master in the Profession. One's earliest recollections of Church Architecture in London were associated with the name of Mr. Pearson. The many buildings of his in London were really grand works of this century. They would miss very much from their meetings so great a master, and more particularly when dealing with Church Architecture.—The secretary formally seconded the vote, which was carried in silence.

BUILDERS BEWARE!

THE LAW OF LIABILITY.

MR. HENRY WADDINGTON, of Bradford, who is legal adviser to the Yorkshire Federation of Building Trade Employers, at a recent meeting of that body, delivered an address upon the Workmen's Compensation Act. To modify the harshness of the doctrine of common employment, he said the Employers' Liability Act of 1880 was passed, by which Act workmen, as defined by the Act, had a right of action conferred upon them against their employers if injured in any of five specified ways. Several attempts had been made to pass a more satisfactory Act, until at last the new Workmen's Compensation Act was carried last session. The

MOST REMARKABLE FEATURE OF THE ACT

was that, for the first time in the history of English legislation, liability had been cast upon an individual to pay compensation for personal injuries which were not the result of any negligence or unlawful act either on the part of himself or his servants, for whose conduct he was legally responsible. In fact, the employer who came within the scope of the Act was made compulsorily the insurer of the servant against injury by accident, however caused. Section 1 provides for compensation for personal injuries by accident arising out of and in the course of employment. The word "accident" was likely to give rise to much dispute. It was provided that the employer was not to be liable under the Act if the injury did not disable the workman for at least two weeks from earning full wages. This would have the effect of largely diminishing the number of claims by workmen. Section 2 provided that notice of action must be given as soon as practicable after the accident. This was an indefinite phrase, and might lead to disputes. Section 3 was a kind of contracting-out clause, as it provided for a scheme of compensation and insurance which should receive the sanction and approval of the Registrar of Friendly Societies. Section 4 dealt with sub-contracting, and was designed to prevent an evasion of liability. It made the head employer or the one who engaged the sub-contractor (in the Act called the undertaker) liable to pay compensation whenever the contractor was liable to pay to the workman. Section 5 would be very useful, and provided that

THE WORKMAN'S CLAIM FOR COMPENSATION

should be a first charge in the event of an employer's bankruptcy or arrangement with creditors. Section 6 provided that, where a legal liability for injury was created against a third party, other than the employer, the workman might proceed against such stranger or the employer, but not against both. In explaining Section 7 he observed that the building trade was not an employment within the Act unless the work was being executed on, in, or about a building over 30ft. high, but there was no guide for the determination of the height of a building. Everyone (except a workman who tumbled off a 20ft. wall into a 20ft. basement) would agree that the height ought to be measured from the ground level, and not from the basement. What the ultimate definition would be could not be said, but as the object appeared to be to limit the application of the Act to the most dangerous work of the building trade, there seemed no reason why the measurement of a building should always be taken from the centre of the building. Moreover, the mere fact that a building in course of construction or repair was over 30ft. in height did not bring it within the meaning of the Act; scaffolding must be in use. The last section was a curiously worded section. Apparently a workman might still contract himself out of the Employers' Liability Act of 1882, or agree to forego any right of action at common law existing on July 1st, 1898. But no contract agreeing to forego any right of compensation would be operative to deprive a workman of his rights under this Act.

Professional Items.

ABERYSTWYTH.—At St. Mary's (Welsh) Church a beautiful executed window has been erected to the memory of the late Dean Phillips, formerly vicar of the parish. The window, which occupies a position in the church on the north side of the nave, is of stained glass, and consists of two figures, one being that of St. Mary, to whom the Church is dedicated, and the other being that of St. David, the patron saint of Wales, to whom the cathedral with which the late dean was connected is dedicated. The design was carried out by Mr. Alf. O. Hemming, Margaret's Street, Cavendish Square, London.

ASTON.—For the new higher-grade school about to be built at Aston, under the auspices of the School Board, a site has been acquired at the corner of Whitehead Road and Ettington Road, opposite the Technical School. In some respects the new school will differ from any other school yet erected, as, in addition to providing accommodation for 560 higher-grade scholars, room will also be provided for male and female deaf scholars and pupil teachers. The general arrangements consist of a school for 280 senior boys and 280 senior girls in separate departments, with two teachers' rooms to each department. A chemical laboratory for fifty scholars and a physical laboratory also for fifty scholars is provided. A properly equipped gymnasium is also to be built, approached direct from the playground. The deaf school provides accommodation for ten children of each sex with separate teachers' room, and is a department entirely apart. The pupil teachers' centre is for the instruction of 120 female pupil teachers, and is approached by a separate entrance and staircase. A caretaker's house is also to be built facing Whitehead Road. The principal façade is to Ettington Road, and although the schools comprise four distinct departments they are arranged so as to form one imposing block of buildings. The style of Architecture is in the form of Renaissance. The composition is well balanced, the main hall being carried up two stories, forming the central feature of the design. The materials will be red brick and terra-cotta, with tiled roofs. The estimated cost (exclusive of site and furnishing) is about £12,000. The architects are Messrs. Crouch and Butler, of Waterloo Street, Birmingham, whose designs were placed first in order of merit by Mr. E. R. Robson, F.S.A., the consulting architect to the Education Department.

DUNDEE.—Early next year building operations will be commenced in connection with the new temperance hotel which is to be provided at Dundee. The plans, prepared by Mr. Robert Hunter, architect, show an imposing edifice of five stories and attics, the general design being conform to that of the buildings in Whitehall Crescent. The total frontage to Whitehall Crescent, South Union Street, and Dock Street, is about 300ft. Externally the building will afford a very pleasing and somewhat artistic aspect. The main entrance, situated immediately opposite the West Station, terminates in a lofty tower of neat design, bow windows being carried up as high as the third story. In Dock Street and Whitehall Crescent the same design is given effect to, bow windows projecting at regular intervals and marking the externals of the principal apartments on the first floor. On either side of the main entrance are pillars and pilasters with moulded bases and carved capitals, and in each of the two other faces any stiffness in outline is obviated by the interjection of this style of ornament, an effect which is heightened by a band of ornate carving running round the three sides of the building. It is proposed to erect nine or ten shops on the ground floor in Whitehall Crescent. The hall will be 50ft. long, while the other rooms (commercial, coffee, dining, smoking, music, &c.) are to be of ample size, the ceiling being 14ft. in height. Ascending from the

principal landing immediately at the office is the grand staircase, which will be abundantly lighted from a large cupola in the roof, and which will also be lighted on each flat by stained glass windows half-way up each flight of stairs, and in which provision is made for flowers.

FLOOKBURGH.—The foundation-stone has been laid of the new church now being erected at Flookburgh. The building now used was built as a chapel-of-ease under Cartmel Priory Church during the reign of George III., and, in addition to its almost hideous aspect both inside and out, is in a position which seems the strangest imaginable for such an edifice. The new church, which is being erected upon a commanding site almost opposite the cemetery, and will cost about £8000, is to seat 450 persons, and will be in the Early English style of Architecture. There will be a nave 62ft. long by 22ft. 10in. wide, at the western end of which will be a massive tower 26ft. 6in. by 25ft. externally, and 53ft. high to the top of the parapet. On the north and south sides will be arcades of four arches—three in the nave and one in the chancel, which is also divided from the nave by an arch 26ft. high. The north aisle roof will be continuous the length of the arcade, but on the south will be interrupted by the organ transept, the gable of which will project slightly beyond the line of the aisle. The height to apex of nave roof will be 39ft., the chancel being about 18in. lower. At the eastern end of the chancel will be a semi-circular apse with stone groined roof, and lit by three lancet windows. Advantage has been taken of the sloping nature of the site to form the vestry under the apse at the east end, equal to 20ft. by 17ft. in area. The church is entered by north and south doors in the tower at the west end. The nave will have a clear story of six lancet windows each side, and the chancel two quatrefoil and one long lancet window. The church is being built with walling of local stone and dressings of Prudham stone, in broken coursed work inside and outside, except in interior of the apse, which will be faced with ashlar. The roofs of the tower, chancel, nave, and organ transept will be covered with stone slates, and the aisles and apse with lead. The roofs and nave seats will be of pitch pine, and the floors of oak blocks laid on concrete bed. The chancel seat blocks will be laid with oak the choir stalls being also of oak. The aisles and passages will be flagged, and the chancel floor laid with encaustic tiles. The work is being carried out by the following contractors:—Masonry, Mr. A. Blair, of Allithwaite; carpentry and joinery, Messrs. Gradwell and Co., of Barrow; slating, Mr. J. Chippendale, of Grange; plumbing and glazing, Mr. A. Moorhouse, of Kirkby Lonsdale. Messrs. Austin and Paley, of Lancaster, are the architects, and are superintending the work.

IPSWICH.—The Ipswich Gas Light Company has just extended its works by the erection of a gas-holder providing new storage for exactly one million cubic feet. The directors entrusted the design of the holder to their own engineer, Mr. J. T. Jolliffe, who made the drawings and drew up the specification and form of tender, and by his own staff and men prepared the foundations on a very treacherous site, it being necessary in places to excavate the ground 15ft. deep and fill in with nearly 2000 yards of cement concrete. The construction of the tank and gas-holder was entrusted to the firm of Messrs. Samuel Cutler and Sons, of London. The material of the entire structure is of superior mild steel, the diameter of the tank being 122ft., and the depth 32ft. 6in. The gas-holder is in three lifts of 120ft., 118ft., and 116ft. diameter respectively, each lift being 32ft. deep. The guide-framing is Messrs. Cutler's patent, the diagonals acting as both ties and struts. The extreme height to the top of the crown of the holder when fully inflated is nearly 140ft. from the base.

KIDDINGTON.—The new screen that now forms the scenery and ornate line of demarcation between the chancel and nave in the parish church of St. Nicholas is constructed of

English-grown forest oak, and is of fifteenth century or Perpendicular Gothic character. It has three bays on either side, and a wide central doorway. The lower parts are panelled up to the transoms, and has tracing work of pleasant design. Above is open work surmounted in turn by pierced tracery, terminating with a chastely carved cornice and pierced cresting of telling outline. The whole blends admirably with the surroundings. The screen has been made by Messrs. Harry Hems and Sons, Exeter.

LEICESTER.—The latest addition to the Baptist Churches of Leicester, "Carey Hall," consists of a chapel and Sunday school, built in red brick with stone facings. It is a free adaptation of the Renaissance style of Architecture, and is a conspicuous ornament to the Catherine Street district. The chapel will seat 900 persons, and can be made to accommodate at least 100 more. The schoolroom seats 500 persons comfortably. Class-rooms and vestries are provided on the ground floor of the school premises. The whole of the ground floor is laid in pitch pine blocks. It has taken nearly fifteen months to build.

MANSFIELD.—The new Church of St. Mark's, Nottingham Road, opened recently, stands well at the corner of Portland Street and Nottingham Road. The west wall of the western aisle comes close down to Portland Street, and above it rises the main west gable, with a fine four-light west window. The bell-turret is placed at the south-east angle of the building, and at the east end the vestries finish with three low gables below the large east window. The external walling is of Mansfield Woodhouse stone, taken from a quarry placed at the disposal of the committee by the Duke of Portland, and the roofs are covered with stone slates and red tiles. The interior consists of a nave and sanctuary under one unbroken roof, with narrow side aisles divided from the body of the church by an arcade of five bays, carried in massive square piers. The passage, or ambulatory, is carried round the east end of the sanctuary with the vestries to the east of it. At the west end the nave and side aisles open into a wide western aisle, which runs across the whole width of the building, and into which, at its north and south ends, the outer doorways open. On the north side of the church, outside the ambulatory, is placed a wide aisle, two bays in length, the western part of which is occupied by the morning chapel, and in the eastern end the organ will be placed. The altar, which stands on three steps at the east end of the sanctuary, is of considerable size. Behind it is the re-table and a carved reredos of oak. The pulpit, with its sounding-board, stands against the third pier of the nave on the south side, and is of oak, with tracery panels, the sounding-board having richly carved cornice and cresting. The main ceiling of the church is of pointed barrel form, with well moulded principals and cornice, and is painted. The floor of the nave is paved with wood blocks, and that of the aisles and sanctuary with Mansfield stone. The details of the interior, which are of a very simple though refined character, follow in manner the fourteenth century style of English Gothic. The architect is Mr. Temple Moore, of 46, Well Walk, Hampstead. The builders are Messrs. Fisher Brothers, of Mansfield.

MONTROSE.—The Montrose Burgh School Board has erected a large Board school to supersede a number of the smaller schools. The building is in the Grecian Ionic style of Architecture. It is a comparatively plain structure, the only embellishments being on the upper story. The frontage to the North Links is 105ft., and to Dorward Street it is 80ft. The walls rise to a height of 55ft. above the level of the pavement. The school has accommodation for 1200 pupils. On the basement floor next to the North Links is the gymnasium—a spacious apartment 47ft. long, 24ft. broad, and 14ft. high—and a class room intended for the teaching of science or any other special subject. This latter room is

divided from the gymnasium by a sliding partition of glass and wood, on opening out which the rooms make a very large apartment of 69ft. by 24ft. The flooring of these rooms is of pitch pine blocks laid on a foundation of concrete, which gives a perfectly noiseless floor. The back portion of the basement is occupied by the bath-room, 60ft. long and 24ft. wide, containing a swimming pond 48ft. by 17ft. The central portion of the basement floor has a fireproof concrete ceiling 9in. thick, and is occupied by cold air inlet, heating chamber, fan, and main air ducts. The school has been provided with Key's patent system of heating and mechanical ventilation. Entrances to the ground floor from the boys' and girls' playgrounds are by short flights of steps to the main entrance doors at either end of the building. From the lobbies open private rooms for the head master and head mistress, which are splendidly equipped, and also the stairs to the upper floors. Divided by glass screens from the lobbies is the general hall. This is a notable apartment, 55ft. long and 22ft. broad, and ascending the whole height of the building. The ceilings of the galleries are all lined with wood, and the supporting beams being panelled with pitch pine, and each gallery being encircled with pitch pine newell posts and handrail, the hall has an imposing appearance. The total cost of the school, when completed, will be about £17,000.

PARTICK.—A new church is being erected at the corner of Lawrence Street and Alexandra Street, Partick, for the congregation of the East United Presbyterian Church. The style of Architecture is thirteenth century Gothic, with generally massive treatment, and simple and severe detail. The central feature of the front is a lofty gable, with broad buttresses at each side. A central buttress of lesser projection divides the gable, and in the lower portion are two four-light windows under flat arches, which spring from the buttresses on each side. Over these are two large triplet windows with cusped heads, occupying the whole space between the buttresses, and recessed under deeply moulded pointed arches. The apex of the gable, which rises over 70ft. above the street, is enriched with a moulded niche, and terminates in a foliated cross. A projecting porch at the south-east corner of the building forms the main entrance, and is more elaborately treated in detail, a richly moulded archway giving access to the wide double doors which open into the inner vestibule. On the west side of the main gable is another doorway, which also forms the hall entrance, and between this and the hall gable, which fronts Lawrence Street, is an octagonal turret, quite plain in the lower portion, and with a series of traceried windows in the upper stage, forming the gallery and hall staircase. The halls and accessory rooms are placed to the west side of the church, but are so arranged that independent use may be made of either, and are accessible from both streets. The side elevations of the church show a series of low four-light windows, with square heads in the lower stage, and in each bay over these, divided by broad piers, are tall two-light windows of lancet shape, with moulded and cusped heads. Internally the same massive and severe treatment is proposed. The nave is divided from the aisles by stone piers, one only on each side, springing from which are moulded arches of wide span. The stone piers are simply splayed, the gallery beams resting on projecting stone corbels, and the inner angles of the piers are carried up to the roof, and form rests for the main roof timbers. The principal roof timbers will be shown, and the ceilings will be lined with wood panelling. The number of sittings provided is 840, and there are also halls for 400 and 200 seated class-rooms, ladies' room, vestry, kitchen, &c. The total cost will be about £7500. The architect is Mr. John B. Wilson, of Glasgow.

PLUMTREE.—The parish church at Plumtree has been restored. In the early part of this year the roof of the church was found to be in an unsatisfactory state, and upon removing

the old lead it was discovered that the whole of the woodwork was in such a decayed and dangerous condition as to render it necessary to remove it and to put on a new oak roof. Messrs. Brewill and Bailey were the architects. The work was rendered necessary because at the former restoration of the church, about twenty years ago, the roof was left in the same state that it was before.

WEYMOUTH.—The Great Western Railway propose to apply at once for Parliamentary powers for carrying out the important harbour and docks scheme at Weymouth, which has been under the consideration of the directors for some time. The Company propose to erect a harbour of their own on the Portland side of the Nothe, which now divides Weymouth Harbour from Portland Roads. To effect this a breakwater will be thrown out from the North Fort and another from the Admiralty Breakwater now in course of construction. This will make a harbour of some 75 acres in extent, and of a sufficient depth to receive vessels of any size at all hours of the tide. Docks and jetties will also be provided as the growth of the service may require. An important part of the scheme also is the construction of a new railway from a point at Ralipole, skirting Wyke and Westham, and passing along the foreshore to the new harbour. By this means the fast trains of the Company will be able to run without check to the quay side. Powers will also be asked for to construct a railway from the docks along the new Admiralty Breakwater, so that the Government vessels and warships may coal with the greatest ease.

WREXHAM.—The site at the corner of High Street and Church Street, which was previously occupied by premises known, from its connection some years back with the North and South Wales Bank, as the "Old Bank Buildings," has been taken over by Parr's Bank, Ltd. The site has a frontage of only nine yards to High Street and ten yards to Church Street. The whole of the ground floor, with the exception of the side entrance passage and staircase, is given up to the exclusive use of the bank, and consists of a room approximately 24ft. square and 12ft. 6in. high. The public space to which the vestibule opens is executed in mosaic, and consists of a ground-work of light mottled pattern, on which a conventional design is traced, surrounded by a boldly-treated border in subdued colours; the remainder of the floor is boarded. The manager's room has a fibrous plaster ceiling in two parts, separated by the beam which supports the division walls of upper floors; it is divided up by moulded ribs into geometrically arranged panels, the principal of which are enriched with conventional ornament. The walls are finished in Keene's cement, crowned by a deep ornamental frieze and enriched cornice in fibrous plaster. In order to devote as much space as possible to the banking room, the outer walls have been constructed of sufficient thickness only to ensure strength and stability, and the massive classic columnar type of Architecture, so frequently identified with banking premises, has been departed from, the exterior having been treated in a phase of English Renaissance, which, whilst lighter in character, is sufficiently indicative of the purposes to which the various portions of the building are devoted. The distinction between the banking room and the offices above is marked, not only by the contrast between the bolder character of the lower portion as compared with the lighter work of the upper floors, but by the scheme of colour treatment adopted in the masonry. The outer walls are faced with stone from the Abenbury quarries of the contractors, Messrs. Davies Bros. The ground floor is executed with the grey ashlar, with dressings of the pink stone, the upper portions being constructed entirely of the latter. The High Street and Church Street façades are similar in treatment, the design of one being the counterpart of the other, with the addition of a narrow bay containing the side entrance from the latter street. The ground floor is finished and the level of the first floor marked by a deep

frieze of curved section, on which the name of the bank is carved in relief, and by a moulded cornice. These are broken round the projections carrying the pilasters of the upper portion, below which are suspended the coats-of-arms of the various places in which the head and principal branches of the bank are situated. The two upper floors of offices are treated alike, the two bays being divided by projecting pilasters, which serve at the same time to mark the interior division walls, and are repeated at the angles of the building. The main windows also project, and are two light square-headed openings with splayed sill, moulded jambs, mullions, heads, and transoms, the upper portions being filled with small rectangular lead lights, and the lower with plate-glass sheets, one half of which are hung in wrought-iron casement frames to open. The whole of the structural work has been carried out by Messrs. Davies Bros. The carving on the façades is the work of Mr. F. G. Lloyd, Victoria Place, Manchester. The heating apparatus and lead lights to banking room have been executed by Messrs. A. Seward and Co., of Lancaster, and the ceilings and cornices, &c., by Thomas Cordingley and Sons, of Bradford. The fireplaces to banking room and to offices on first floor are supplied by the Teale Fireplace Co., of Leeds, and the gas fittings and ornamental ironwork by Messrs. Hardman, Powell, and Co., of Birmingham. Messrs. Waygood and Co., of Falmouth Road, London, supplied the lift, and Messrs. Chubb and Co. the armour-plated doors to strong room and plate store. The window panes to upper floors were manufactured by Messrs. R. L. Williams and Co., of Chester. The whole has been carried out from the plans and under the superintendence of Mr. J. H. Swainson.

THE PURIFICATION OF SEWAGE.

AT a recent meeting of the London Society of Arts, a paper was read by Dr. Samuel Rideal, on the "Purification of Sewage by Bacteria." He remarked that the success which attended the experiments at Exeter on the disposal of sewage by means of the septic tank process, made the present time a fitting one to review the whole problem of sewage disposal. The various methods based upon chemical precipitation and subsequent land treatment of the effluent had given results which had seldom been satisfactory economically, and which had often been disastrous from other causes to such an extent that many authorities were refraining from the erection of works on the old lines. The difficulties were usually due either to the injudicious and extravagant use of chemicals or to the unsuitability of the land acquired for the treatment of the effluent. Thirty years ago methods of upward filtration were suggested in the place of chemical precipitation, and the results obtained were so satisfactory that it was difficult to understand why chemical treatment was so universally adopted. In judging the results obtained by these newer processes of sewage purification, they were brought face to face with the problem as to what might be regarded as a satisfactory effluent. The standard fixed by the Rivers Pollution Commission was formulated on the ground that no river in the United Kingdom was long enough to secure the destruction of any sewage. Experiments had shown that this was not the case. Dr. Dupré had succeeded in arresting putrefaction of London sewage, by adding thirty-five times its volume of London tap-water. The agencies in this process were almost entirely bacterial. After partial nitrification in a filter, the action of another class of bacteria, which absolutely required a certain amount of organic carbon as food, converted the latter into carbonic acid and harmless gases, the oxygen required being taken from the air or from that dissolved in the water. After a number of careful experiments, he considered that an effluent which was in an active state of self-purification, if clear and nearly free from odour, might safely be discharged into a river of moderate volume.

Enquiry Department.

We have pleasure in announcing that the services of specialists in every branch of the building industry, or representative of every phase of architectural thought, have been secured in connection with our "Enquiry Department." We shall at all times be pleased, therefore, to receive queries from correspondents, and lay them before the specialists concerned, who, in their turn, will be pleased to give the fullest and most accurate information.

ACME LEAD FLINT GLASS CHIMNEYS.

In a recent issue of the BUILDERS' JOURNAL there appeared the following enquiry, received from a correspondent: "Can you inform me through what merchants I can buy 'Acme' lead flint glass chimneys for incandescent lights. They are made in the United States of America, and the trade-mark etched on each chimney is 'Trade Mark—Acme—Lead Flint.' They are wrapped in pink printed paper." We stated in reply that the chimneys in question would shortly be obtainable from a certain London firm, who had informed us that they had just contracted an agency with the makers, and had had a consignment of the articles shipped to them. This reply provoked some correspondence, and after making full enquiries we learn that the makers of the Acme Flint Glass Chimneys are Messrs. Gill Brothers and Co., of the "Acme" Flint Glass Works, Stenbenville, Ohio, U.S.A. Messrs. Gill's representatives in this country are Messrs. S. Hoffnung and Co., whose office is at 102, Fore Street, E.C. The Acme Flint Glass Co., of 81, Newhall Street, Birmingham—who have also been in correspondence with us on this subject—hold the sole right of sale in Birmingham, the North of England and Ireland, by virtue of concessions from Messrs. Hoffnung and Co.; and we are desired to make this fact known, as our original statement to the effect that another London firm had contracted the agency might possibly prove detrimental to their interests. We have pleasure in carrying out the wishes of the Acme Flint Glass Co.; and we would also ascribe to the Acme flint glass chimney the merits it possesses. The chimneys are composed of the finest material—they are made of Acme lead-flint glass—and will withstand any heat. We have received a sample of the article, and can testify to the excellence of the workmanship and finish.

THE PRESERVATION OF TIMBER.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you please let me know of any book dealing on the preservation of timber by creosoting, and shewing drawings of a plant used for the purpose. Also the name of any maker of a creosoting plant.—Yours faithfully,

HUGH MILLER.

We do not know of any book dealing specially with the subject of creosoting or of any that contain illustrations of the requisite plant, but some information relative to the process is given in "Scott Burns' Carpentry," publisher, John Murdoch and Son, London, and Rivington's "Notes," Vol. III., "Materials." So far we have been unable to discover any manufacturer who makes a speciality of the plant, but Messrs. Easton, Anderson, and Goulden, of Erith, and 3, Whitehall Place, S.W., make pumping engines and suitable cylinders, and they would probably quote and advise.

THE COST OF ILLUMINANTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be glad if you can inform me what the relative cost of gas and electric light is, or how many Board of Trade units of electric light would go to 1000ft. of gas—the amount of light given being the same in either case.—Yours faithfully,

G. F. G.

The comparative cost of gas and electric lighting will depend upon the quality and cost of gas, and the cost of electricity. If the comparison refer to the "common" gas of the

Gas Light and Coke Company, London, which has a light-giving quality of 16-candle power (16 c.p.) per 5 cubic feet per hour, and cost 2s. 6d. per 1000 cubic feet; and to electricity, costing 7d. per Board of Trade Unit (B.T.U.), the ratio will be about 1 to 3 in favour of gas as the cheaper light, as will be seen from the following calculation:—

Gas—
5 cub. ft. per hr. yield 16-c.p. per hr.
1000 " " " 3200 " " " at a
cost of 2s. 6d.
Electricity—
'064 B.T.U. yield 16-c.p. per hr.
12'8 " " 3200 " " " at a cost
of 7d. per B.T.U. or 7s. 5½d.
Ratio:—2s. 6d. to 7s. 5½d.,
or 1 to 2'98.

As the cost of electricity varies from 8d. to 4d. per B.T.U., 7d. is rather high. If the "Cannel" gas of the Gas Light and Coke Company be taken into account, the ratio would be 5 per cent. higher in favour of gas. From the foregoing calculation it will be seen that 12'8 units of electricity are required to give the light of 1000 cubic feet of gas; also, that as 12'8 times the price of 1 B.T.U. is to that of 1000 cubic feet of gas, so will be the relative cost of the one to the other.

COMPOSITION OF BUILDING STONES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—As a regular subscriber to your publication I should esteem it a great favour if you would (through your enquiry department) kindly describe the composition of the following building stones: 1, Caen; 2, Bramley Fall; 3, Forest of Dean.—Yours faithfully,

H. P. R.

The first, i.e., Caen, is a Jurassic limestone, and is almost entirely composed of pure carbonate of lime, about 95 per cent.; the other constituents being carbonate of magnesia and alumina. This stone sometimes exhibits an oolitic structure and at others a compact one with small spathic scales. It is easily cut, is pale cream-yellow in colour, and weighs 120lb. per cubic foot. It is found in the lower Oolite, and encloses ammonites, belemnites, and other fossils corresponding to those of the Bath stone of England. The variety of this stone, called Calcaire Marble of Caen, is destitute of fossils, and exhibits other colours than those described, such as yellow coloured with rose, grey, and sometimes a lively red. The second, viz., Bramley Fall stone, is a coarse-grained sandstone, light ferruginous brown in colour, and is composed of quartz grains and decomposed felspar, with a little mica in a granular form, united together with argillaceous cement. Its ferruginous spots are disseminated. Some qualities of this stone contain an excess of potash-felspar, and the stone therefore weathers badly, in fact, from its composition, it is at all times unadvisable to use this stone in damp situations. The third—i.e., Forest of Dean—is a sandstone obtained from the coal measures. It is found in three beds, each of which is harder than the one above it, the bottom one being of very hard grit. The tints of the two top layers are usually grey, sometimes inclining to brown, the third being bluer in colour. The different colours are probably due to a great extent to the difference in the cementing material, the blue colour being due to the presence of bisulphide of iron, the reddish-brown to anhydrous peroxide of iron, and the greenish-grey to sandy particles of the mineral glauconite or to proto-silicate of lime. The analysis of the two sandstones is as follows:—

Composition.	Bramley Fall.	Forest of Dean.
Quartz grains } or Silica	per cent. 93	per cent. 96'40
Carbonate of lime	" "	" " 36
Argillaceous Cement... ..	" 3	" "
Iron alumina	" 2	" 1'30
Water and loss... ..	" "	" 1'94
Decomposed Felspar	" 2	" "

Correspondence.

NOT GUILTY?

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—One cannot but admire the zeal of your correspondent "Stonemason," in defending the worker against the assertions of "A London Architect" and "A London Builder," but I hardly think that he will get the support of any who have made the working man a study from a business point of view, because everything tends to prove that the inroads made into the liberty of men by trade unionism have not been to the benefit of the worker, but have fanned a flame of discontent that asserts itself in the lack of interest which the worker has for his work. I do not deny that "Stonemason's" forty years have been spent in honestly doing his duty, but such instances are rare, and a master cannot, as your correspondent suggests, give a workman his notice, when the law of supply and demand is, as at present, so much in favour of the workman. The charges made against the building fraternity are of such a character as to require considerably more proof than bare assertions. Such practices may be indulged in by those not worthy the name of business men, but this should not be sufficient ground for a sweeping charge against the vast majority of professional and business men, who, as a class, are vastly superior to those they employ as far as regards honesty as a principle. When "Stonemason" asserts that the subject under discussion is only a bogey, he makes a big mistake, which any employer of labour can prove by referring to his books, and as facts speak louder than illusionary trumpetings, it would be better for "Stonemason" to have something more substantial than mere mythical assertions to prove his contentions.—Yours truly,

SE DEFENDENDO.

York, December 13th.

SKIPTON COTTAGE HOSPITAL COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Now that the award has been made in the Skipton Cottage Hospital Competition I beg to put before you a few glaring inconsistencies, and to ask your opinion as to the fairness of the committee and the assessor. Condition 4 of the competition says: "No perspective view will be allowed." Yet an elaborately coloured perspective view was amongst the drawings of the successful competitor. Then the successful competitor sent in a set of amended drawings before the award was finally given, to the exclusion of other competitors. Then the conditions state that "preference will be given, other matters being equal, to plans showing the strictest economy in their design and the future management of the hospital; and the cost for sixteen beds, with the usual appurtenances, not to exceed £2500." I venture to think the selected plans neither economical in design nor for future management; as for the cost, that may safely be left open, as it will speak for itself in due course. Then a circular letter from the committee's secretary to the competing architects says:—"You will like to know that the plans were all examined and reported upon by an eminent firm of architects in London." The name is not disclosed, and I can scarcely think that a London architect of repute would lend his name to a selection, which in my opinion is very unjust. In justice to the selected architect, I must say his plans are creditable, but there can be no sense of right in either a committee or an assessing architect who can award the premium to plans in which the conditions are so flagrantly overlooked. I should be glad to hear the views of competitors or others interested.—Yours truly,

VERBATIM ET LITERATIM.

WORKING drawings are now in hand for the new subway, for which the County Council has obtained Parliamentary powers between Greenwich and the Isle of Dogs.

Under Discussion.

THE WINTER SESSION.

SOCIETY OF ENGINEERS.

The forty-fourth annual general meeting of the Society of Engineers was held a few days ago at 17, Victoria Street, Westminster, S.W., Mr. George Maxwell Lawford (President) in the chair. The following gentlemen were duly elected by ballot as the Council and officers for 1898, viz.:—as President, Mr. Wm. Worby Beaumont; as Vice-Presidents, Messrs. John Corry Fell, Henry O'Connor, and Charles Mason; as ordinary members of Council, Messrs. James Patten Barber, Joseph Bernays, George Burt, David Butler Butler, Percy Griffith, Richard St. George Moore, Nicholas James West, and Maurice Wilson; as hon. sec. and treasurer, Mr. Perry Fairfax Nursey; as hon. auditors, Messrs. Alfred Lass, F.C.A., and Samuel Wood, F.C.A.

EVOLUTION OF STYLE IN ARCHITECTURE.

At a meeting of the Edinburgh Architectural Association, Mr. Thomas Ross, the president, in the chair, Mr. Leslie Ower, president of the Dundee Institute of Architecture, read a paper on "The Evolution of Style in Architecture." There were, he stated, many influences at work in the development of the styles, such as climate, materials, habits of the people, political disturbance, and so on; and in modern days they had such influence as new materials, scientific inventions, facilities for travel and transport, and the like. One of the baneful influences of our commercial and city life on Architecture was smoke. It was not encouraging, to say the least of it, to see a fine piece of Architecture become in a year or two, sometimes almost before it was completed, so soot-begrimed that it lost much of its effect. Surely engineers and scientists were not yet prepared to admit that everything had been tried, and that the cure of this great evil was beyond them. The thought had been expressed by many, why was there no new style of Architecture invented? And they lamented the inartistic spirit of our time, which seemed to them to fall behind past ages in this respect. These people forgot that no architectural style had ever been invented, but had been the slow growth of centuries, and a little reflection would show that it was not to be expected, even in an age like ours, unsurpassed for progress in science and invention, that either new materials or inventions would quickly work such a radical change in building design and construction as to create anything that could be called by the honoured name of a style. The world moved slowly in such matters, and it might even be that, all unknown to ourselves, as it had always been to those who were the busy agents in producing it, a style might be developing under our hands and eyes which, in the estimation of following generations, would be fit to take rank alongside the great architectural styles of the world. —The lecture was illustrated by lantern views of ancient and modern buildings.

THE CHURCHES OF CYPRUS.

At a recent meeting of the Oxford Architectural and Historical Society, Mr. Myres read a paper upon "The Churches of Cyprus." The periods of the various styles, in the first place, were clearly defined, and the advance in Art ran pretty equally with that in South France. The first dated cathedral was 1291, but there are forts in the hills, upon heights inaccessible to those who cannot climb trees, and there are some late Byzantine castles. In the south of the island are two or three Lusignan forts and the remarkable tower of Colosse, of Early Gothic type, perhaps the work of the Templars. A distinguishing feature in almost all the styles was the chevron ornament, treated in many ways, and not, as in England, confined to Norman or Transitional. It occurs even in sixteenth and seventeenth Turkish buildings. The buttress did not, in Cyprus, take that four-sided plan so

customary with us; it is sometimes semi-hexagonal, sometimes semi-octagonal. Most of the ecclesiastical buildings are groined, and in early examples this is generally worked without projecting ribs. Wooden roofs are seldom seen; they are of concrete, and are very flat, being used as promenades. They are accessible by newelled staircases, and have but slight parapets. Gurgoyles and water spouts are conspicuous in some of the buildings. Such heavy roofs would be in danger of collapsing, but where the concrete mass is thickest they follow an old custom of placing in the midst tough vessels of earthenware, and their hollowness lightens the load upon the haunches. Triple apses are almost the rule, and the groining of these is frequently carried into the nave roof, for there is no structural chancel, the pattern (a simple rectangle) having come down from the Roman basilica. In some instances he noticed that the flying buttresses, requisite where so much and lofty vaulting is used, rest upon side walls, not upon projecting buttresses, as with us. One fine church was so full of granary fittings that the interior construction could not be understood. The cathedral of Famagusta and several other churches have two western towers, reminding us of Lichfield. The cathedral has its wide windows filled with Turkish lattice-work, neither beautiful nor pleasing, and its internal fittings have undergone a complete wreck. The efforts of the English to check the destruction of ancient structures has so far been moderately successful, but it will be some time before restorations or even befitting repairation can be attained.

The Vestry of St. Margaret and St. John, Westminster, has addressed a circular letter to the other London sanitary authorities stating that certain property occupied by Government departments in Westminster had been found to be in defective sanitary condition and dangerous to the public health, owing to such property not being subject to the provisions of the Public Health Act, 1891. They have already asked the Local Government Board and the Office of Works to provide access for sanitary officers to all barracks, post offices, and other Government institutions, and they ask for general support for this proposal.

MR. H. B. BOULNOIS, C.E., on behalf of the Local Government Board, has held an enquiry at Meltham into an application by the District Council to borrow £16,000 for works of sewerage and sewage disposal. The total estimated cost of the works, including the purchase of land, is £15,538. The outfall works will occupy eleven acres, and it is proposed that purification shall be secured by precipitation and filtration. Originally the works were designed so that trade effluents might be dealt with, but the District Council have since decided not to take in trade effluents, in view of difficulties anticipated from riparian owners, and also from the fact that the streams have to provide compensation water to the mill-owners on their banks.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERDEEN.—For the erection of school and residence, Inchmure, for the Banchory-Davenick School Board. Mr. R. G. Wilson, architect, 181A, Union-street, Aberdeen. Quantities by the architect.

Masonry.—Jas. Reid, Banchory Devonick, Aberdeen.
Carpenetry.—R. Thomson and Sons, Bon-treelush, Aberdeen.
Slating.—Geo. Currie, Aberdeen. £1,726 12 6
Plastering.—Alex. Ross, Aberdeen.
Plumbing.—J. F. Anderson, Aberdeen.
Painting.—D. McLennan, Cults, Aberdeen.

ASTLEY (Salop).—For the erection of small house, for Mr. James Wallace, Mr. J. R. Withers, architect, Shrewsbury.
G. H. Bickerton. £295
G. Bullock. 95 Tommy Bros., Wem* 811
T. Morris. 555 *Accepted.

CASTLEBAR (Ireland).—For the execution of water supply works, for the Governors of Castlebar District Lunatic Asylum, Mr. G. K. Dixon, O.E. Quantities by engineer.
James Galloway and Sons, Sligo. £200

CASTLE BROMWICH.—For the execution of sewerage works (2,800 yds.), for the Rural District Council. Mr. J. E. Wilcox, C.E., Union Chambers, Birmingham.
Curral & Lewis. £2,100 14 0 H. Holloway. £2,273 18 1
Jacob Biggs. 3,000 0 0 George Law. 2,200 0 0
J. White, jun. 2,000 0 0 J. C. Trueman. 2,075 0 0
T. Vale. 2,300 0 0 Henry Law, Ches-
John Mackay. 3,300 0 0 ter road* 1,787 0 0
*Accepted.

DEVONPORT.—For paving Granby-street and Herbert-place-lane, for the Rural District Council. Mr. J. F. Burns, Borough Surveyor, Municipal Offices, Devonport.

T. Shaddock. 2328 6 2
C. L. Duke, Plymouth (accepted). 251 4 3

T. Shaddock. 2414 17 7
C. L. Duke, Plymouth (accepted). 343 13 5

FRODSHAM.—For new warehouse and offices, Frods-ham, for Messrs. Kydd and Kydd, Limited, jam and pre-serve manufacturers. Mr. Samuel Davies, Runcorn and Frods-ham, architect.
John Little, Frods-ham (accepted). £1,436

FRODSHAM.—For new house, Frods-ham, for Mr. Thomas Lewis. Mr. Samuel Davies, Runcorn and Frods-ham, architect.
Thomas Davies and Sons, Frods-ham (accepted). £450

FRODSHAM.—For extensions to "Fir Grove," Frods-ham, for Mr. Reynolds. Mr. Samuel Davies, Runcorn and Frods-ham, architect.
R. and G. Gleave, Frods-ham (accepted). £325

FRODSHAM.—For stable buildings, Netherton, Frods-ham, for Mr. Thomas D. Timmins. Mr. Samuel Davies, Runcorn and Frods-ham, architect.
Thomas Davies and Sons (accepted). £325

GOSPORT.—For the erection of two houses, Parham-road for Mr. Thos. Hy. Smith. Mr. Harry A. F. Smith, architect and surveyor, Gosport.

J. W. M. Rapley. £795 O. M. Dash, Gosport* £669
A. Habens. 725 Lane and Son. 656
C. Jupe. 720 *Accepted.

"EMPRESS" SMOKE CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney-pot.

Full Particulars of Sizes, Prices, &c., on application to the Makers—

James Marshall, architect, 2, 1/2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000.

BRECKENFELT.—For additions, &c., to house West View, for Mr. M. James Marshall, architect, 2, 1/2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762,

Surveying and Sanitary SUPPLEMENT.

DECEMBER 29TH, 1897.

Practical Carpentry and Joinery.*

BY GEO. ELLIS.

(Continued from page ii.)

FLOORS in buildings are composed of the "naked flooring," a skeleton timber, or iron framework, used to support the covering, and the covering itself, termed "the floor." The naked floor consists of joists, binders, girders, and wall-plates, used separately or together, according to the size of the space to be covered. These are all of unwrought timber, in marked sizes, clean from the saw, and should be dry, free from sap and large knots; straight and regular shape, although desirable, is not essential to the safety of the construction. A good floor should be free from vibrations, rigid, exhibit no thrust on the supporting walls, except in a downward direction, and it may usefully act as a tie to thin walls. To that end it is usual, in dwelling houses, to run the joists from back to front, these being the walls that require the most support. When, however, this is not necessary, it will be found best to run them in the direction of least span. When the floor consists of a series of joists, bridging the void from wall to wall, or partition, without intermediate support, it is known as a single floor (see Fig. 48). This kind may be used for spans up to 18ft.; and if not required to carry ceilings with them, up to 14ft. It is not advisable to use them for greater spans than these, as to make them sufficiently strong joists of great depth would be required, and it is found more economical in space and material to use binders. Thin deep joists make stiffer floors than thick shallow ones of the same sectional area; 1½in. is, however, the thinnest that should be used, or the floor brads will cause them to split. The necessary depth can be found by dividing the span in feet by two—adding two, and calling it inches; for instance, span 12ft. $12 \div 2 = 6 + 2 = 8$. The thickness can be ascertained by calling the span in feet, inches,

FIG. 51. WALL-PLATE BUILT-IN.

FIG. 52. PLATE ON BRICK CORBEL.

FIG. 53. PLATE ON STONE CORBEL.

and dividing by 5; the quotient will give a safe thickness in inches, add ½in. for ceilings. About every 5ft. of span the joists should be crossed with a row of herring-bone strutting, as shown in Fig. 48. This adds greatly to the strength and stiffness of the floor, and also distributes the load. The joists at the end of each row should be packed out from the walls, and in case of floors likely to receive sudden shocks, iron bolts should be passed through two or three of the joists next the wall, and tightened up with nuts, thus forming them into a kind of horizontal truss to absorb the concussion. There are several methods employed to fix the ends of the joists, each with its especial advantages and faults (see Figs. 51-56). The commonest is probably the worst, that of building it into the wall, as the dampness frequently sets up dry rot, and unless a template is used, there is no distribution of the weight. A wall-plate built in the thickness of the wall (as in Fig. 51) is open to the objection that, in the case of fire, its destruction might cause the collapse of the wall; it is also liable to dry rot. Placing the plate on a set-off, or on piers as indicated by the dotted lines, is an improvement, but reduces the size of the room below. The use of a corbelling course (Fig. 52) requires careful supervision to prevent the introduction of defective bricks, which might prove highly

dangerous. The stone corbel (Fig. 53) built in the wall every few feet is stronger than the former, but is liable to fail in case of fire, as intense heat causes stone to fracture. Wrought-iron brackets (Fig. 54) built into the wall meet the latter difficulty, but do not sufficiently distribute the weight of large floors. A good method is shown in Fig. 55. Here a wrought-iron bar is laid on the brickwork, and the ends of the joists rest upon it. This does not, however, provide any tie, and a method adopted by the writer has met with some favour. (See Fig. 56.) A T-iron bar, 2in. by ½in. by ½in., is bedded on the wall in cement, first painting it with red lead, and the joists notched over the projecting member. Ground floor joists should rest on offsets or piers, and dwarf or "sleeper" walls be built at intervals to support them. The joists can be made much smaller than for upper floors. The wall-plates should be of oak, creosoted to protect them from the dry rot. Fender walls should be built around the fireplaces to carry wall-plates in place of trimmers. In the upper floors, all the fireplaces and other openings require trimming round, i.e., the ends of the joists kept short to provide the opening are tusk-tenoned into a thick cross-joist, called a trimmer, framed in a similar manner between two of the bridging joists, which are then known as trimming joists. All the joists mortised into should be made ½in. thicker for each joist carried, or by rule-of-thumb 1in. thicker than the common or bridging joists. The double floor (Fig. 50), consisting of single joists and binders, is used for spans too great to be bridged by a single floor. The binders are large beams laid across the shorter span every 8ft. or 10ft., their ends resting on stone templates built in the wall, in a little recess or pocket, for ventilation. The bridging joists can be notched or coggied over the binders, to reduce the height (as shown in Fig. 57) when notched; fillets are nailed on each side of the binders to take the bearing of the lower part of the joists, and a similar method is adopted for fixing the ceiling joists. Coggied, which may

be used for the upper edge of the binder without much detriment, as it is in compression, should never be permitted for the ceil-

top to form an intermediate floor joist. The binders are framed into the girder with stub tusk tenons drawbore pinned. The mortice should be

draw the shoulder up. The haunching above the tenon should taper, as shown, to avoid weakening the girder, its sole use being to prevent the binder twisting. Binders must not be placed in line, the bays varying about 1ft. to avoid having a mortice on each side of the girder in one place. In some instances this would make one of the case bays too great a span for the bridging joists, and cast-iron stirrup shoes (Fig. 59) are used to carry the ends of the binders, but the danger of their use is that in case of fire they would snap and drop their load.

(To be continued.)

A NEW reception house, erected by the vestry of St. George-the-Martyr, Southwark, has recently been opened. The building is capable of accommodating four families. It is situated in King James Street, and its erection has cost £2000.

THE new sewage purification works of the burgh of Loanhead have been opened. At the opening ceremony, Mr. A. W. Belfrage, C.A., Edinburgh, gave an explanation of the undertaking. He stated that formerly the drainage from Loanhead flowed into the May and Wading burns, but objections were raised, and proceedings threatened by the riparian proprietors, which necessitated the Commissioners taking steps to remedy the matter complained of. They consulted his firm, who advised them to adopt the international system of purification by precipitation and filtration, which has been carried out. Owing to the situation of Loanhead, it was necessary to have two different outlets, and this necessitated two sets of tanks, &c., in fact, two systems, each complete in itself. New pipe sewers have been laid throughout the whole of the burgh, according to the most approved method, the old sewers being retained for road and surface water, which is not taken into the new system, but is discharged into the burns, as formerly. The sewage from the southern and larger section of the burgh is conveyed to the precipitation tanks, &c., constructed in Haverall Wood.

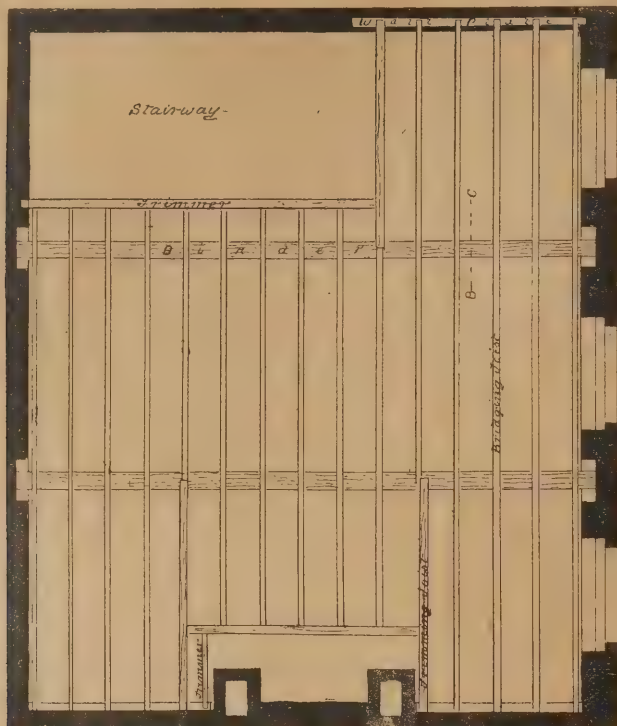

FIG. 50. A DOUBLE FLOOR (PLAN).

ing joists, as the lower edge of the binder being in tension would be seriously weakened by having its fibres cut. The chase mortice shown in the sketch (Fig. 57) is open to the same objection, though to a lesser extent. As most of the weight of the floor is collected on the binders, their ends should not be placed over openings, or, where this is found unavoidable, a strong lintel or girder should be thrown across to receive them, and carry the strain to the piers. Binders are sometimes wrought on three sides, and moulded on the lower edge, the ceiling being fixed direct to the bridging joists, or every fifth one is left 1in. deeper, and the ceiling joists notched to these. This latter method is useful to gain height and intercept sound. Another method of preventing the passage of sound is by pugging the floor. This consists in laying rough boards loosely between the joists on fillets nailed on each side, and covering them, to a depth of 3in. or 4in., with coke breeze cement or slag wool. Air spaces should be left above and below, and 3in. holes bored through the top part of the joists for ventilation, otherwise dry rot will be set up in the timbers. To ascertain the size of binders for any span, assume 5in. wide and 8in. deep as a standard for a 10ft. span, then for each 2ft. of span in addition add 1in. to depth and 3in. to thickness.

When the span exceeds 22ft., the depth of the binders to ensure stiffness becomes too great, and a third member is introduced into the construction, the girder; forming what is known as a framed floor. Girders are large beams arranged about 10ft. apart in the direction of the smaller dimension of the room, with the binders framed between them, and carrying the bridging and ceiling joists arranged in the same manner as in double floors. These floors, although employing more timber, are not comparatively so strong as double floors, in consequence of the number of joints necessary for their construction—which are all points of weakness—and the concentration of the total weight at two or three points in place of its equal distribution over the walls. Fig 58 is a section of a portion of a framed floor taken through one of the binders, and showing a flitched girder, with joists notched and coggled. Two strips of brandering are nailed along the under side of the girder to level down to the ceiling joists, and form a continuous fixing for the laths. A furring piece is also spiked to the

made in or above the neutral axis of the beam, and the thickness of the tenon should be one-sixth the depth of the binder; the tusk should be half the width of the shoulder and 1in. deep. This must fit accurately, as it takes most of the weight, the tenon being used to

THE MANCHESTER CULVERT SCHEME.

IT is stated that the Ship Canal Company objects to the culvert for the conveyance of the effluent from the Davyhulme sewage works terminating at Randles sluices. The Company, it is understood, desires that arrangements shall be made whereby the effluent may, if deemed necessary—in times of drought, for example—be turned into the canal at a point between Woolston Weir and Walton lock. The line of the proposed culvert, leaving Davyhulme on the southern bank of the canal, runs in a course more or less parallel to a point immediately below the Stag Inn swing bridge, some two miles beyond the Latchford locks. At this point it is proposed to syphon under the canal, making an outlet into the River Mersey a little below Walton lock, and between that point and the new road constructed by the Canal Company across Arpley Meadows. From this point the culvert proceeds along the northern side of the canal for a length of about three miles to the main outfall at Randles sluices. It is thought, says the Manchester Guardian, that the proposal for a joint scheme for Manchester and Salford, instead of relieving, would add to the difficulties of the situation. The Salford effluent entering the canal above Barton locks, notwithstanding its nastiness, has, from a navigation point of view, a distinct value for lockage purposes. On the other hand, the Manchester

EFFLUENT ENTERING THE CANAL below Barton locks is of slight local value. It assumes importance at a lower point. Its abstraction from the volume flowing through Warrington would be serious. It would add to the labour of dredging by diminishing the scour, and in dry seasons would probably interfere with navigation in the Warrington section of the Mersey. The plan proposed by Alderman Southern last year, and adopted by the Council, but rejected at the meeting of

ratepayers, was to shorten the culvert considerably and place its outfall at a point above Warrington. This course would obviate some of the difficulties involved in the present scheme; but there is one objection to this plan which has hitherto been regarded as insuperable—viz., that it would still leave the outfall within the jurisdiction of the Mersey and Irwell Joint Committee. Possibly, if the culvert scheme is finally adopted, a solution may be found by making the proposed outlet at Walton the terminal outfall. It would save the cost of three miles of culvert, and it would avoid the dangers involved in placing the outfall at Randles sluices.

An Architectural Causerie.

THE association of "The Migration tombstones and yule-of Ghosts." logs is one of those odd contradictions exemplified by lugubrious glee-singers and jovial undertakers; and there is hardly a periodical at this cheeriest season of the year which is without some thrilling ghost story or tale of haunted graveyard. We should, therefore, be missing a great opportunity were we to allow this New Year to become middle-aged without an attempt to drag forth our particular skeleton from his cupboard, and throw a little more light upon the architect's ghost. There are those who tell us that this ghost is a thing of the past, and that the bent-backed toiler for other men's reputation is banished for ever, since associations, academies, and institutes have made him realise the meaning of Swinburne's lines:

Unto each man his handiwork,
Unto each his crown.

Certain it is that the respectable, old-fashioned ghost is no longer extant to any marked degree, but in his place there has sprung up migratory spirits, haunting one office after another, restless, transitory, wandering ghosts, who call for our special attention, if not for themselves, at any rate for the influence they have upon the Architecture of the present day. The assistant and the ghost are quite separate entities; the one helps the work, the other is the spirit which animates the work. Every architect with a practice must employ assistants, no architect need employ a ghost. We are informed, however, that the ghost is quite content to remain invisible, and rather resents any pity which may be expended on him; being an artist and an altruist he works for his Art, and as long as that does not suffer he is perfectly satisfied. This seems a very delightful state of things to the superficial observer, but it will hardly bear analysis. Our contention is that the work does suffer, and must continue to suffer so long as there is one man to design and another to carry out the design, with all the responsibility which it entails. It is difficult to over-rate the importance of the author of a building identifying himself with that building from start to finish; yet how many ghosts there are who never even see their designs in execution, much less superintend them. The modern ghost is employed to fill the gap which his employer has vacant—possibly this means to supply the Architecture which is sadly lacking; having done this to the best of his ability, he migrates to some other "architect's" abode, creating a strange similarity of style between the work of architects "A" and "B." The British public, however, remain in blissful ignorance, and eventually a client, struck with the clever domestic work of "architect A," commissions him to build a house, little knowing that the style has changed with the ghost, and that "Mr. B" is the man who could best fulfil

his requirements. It may be strange that clients can be gulled in this manner, but it is humiliating to have to observe certain architects deceiving the public, simply because the man in the street knows absolutely nothing about Architecture as the practice of the Profession. Architects, of course, have their limitations, and the busy practical man often has not the time or ability to devote himself to the drawing-board; yet surely there must be a way

is given to the names of all those associated with an exhibit. It is ridiculous to suppose that a firm suffers which acknowledges the help derived from those employed on some pieces of work, or that the names are printed to satisfy the vanity of the craftsmen. Perhaps the day will not be far distant when the architect will accept his limitations, and, in the event of his employing a ghost, gladly give him the credit for his share in the work; the process may considerably swell the bulk

MONUMENT IN PALERMO. DATE 1200 A.D. SKETCHED BY A. N. PRENTICE.

to solve this ghost question, and to stop that migratory spirit which is so injurious to the artist and his Art. The idea of partnership has many objections, financially and otherwise, although there are instances where the ghost has blossomed into the junior partner, with great advantage to the firm. The catalogues of some recent exhibitions, notably that of the Arts and Crafts, seem to teach a lesson to architects in the prominence which

of our Academy catalogues, but we shall have reached a healthier state of things than has existed for many years. And with such a custom established, would not the poor ghost benefit in many ways? His own reputation—and future commissions—would be at stake; but above all, in acknowledging his work, we should be giving unto Cæsar the things which are Cæsar's.

H. S. M.

UNLIKE the vulgar little boy immortalised by Bret Harte, he was very proper, and looked after the office at No. 7 with a dignity that was out of all proportion to the duties he had to perform. He was short, round, robust, and red haired, and came to No. 7 half-an-hour before the others to dust the desks, brush the room, and generally put things straight. During the time when not engaged in mixing colours, or doing some odd job for the assistants, he was allowed to colour in the walls of some plan that was required in a hurry, and if at any time the work seemed to hang fire, as it so happened occasionally, his little head, crowned with an aureole of brilliant red hair, might be noticed poring over a drawing-board of unusually large dimensions, with paper pinned upon it to match. His small stature made it awkward for working the long T-square, but this difficulty, after some consideration, had been overcome by utilising a box to stand upon, and then, by dint of some straining and manoeuvring of his rotund person, he could push the square to the upper part of the drawing-board. Just at present he was setting out the perspective of a dome, which engaged nearly all his attention. Every modillion of the cornice from which the dome sprang was beautifully and accurately drawn in. The great pride with which every one was completed compelled him at times to drop off his box and trot round the drawing for a general survey, much to the amusement of a clever youth sitting on the stool next him. This youth, who had, by the way, great influence over the little would-be architect, would have worn upon his cadaverous countenance a look of having "sifted all philosophies" if it had not been for his eccentric eye. It was an eye hardly suitable for an architect's office: restless, and in moments of excitement, even unmanageable. But such as it was, it had a strange and weird fascination for the boy, and became, in seasons of depression, a sign, a symbol, so to speak, of assistance, for he seldom left the side of the youth without visibly recuperating under his friendly yet wandering gaze. His only relaxation from duties, for the most part self-imposed, was to visit the lady who kept a sweet shop over the way. Here he would throw off his dignified air and become almost frivolous, and to show his appreciation of the lady's charm who served him daily with lemonade, he would, when in a more than usually amiable mood, present her with a special pencil of hexagon shape, solemnly and calmly pinched from his master's store a day or two before. It has already been said that he was seldom other than dignified. It mattered little whether it was a pencil to be purloined, a packet of envelopes, writing or drawing paper to be removed, it was all done in that quiet yet cheerfully Pagan fashion that his best friend would have demurred to quoting for his moral benefit, "Thou shalt not steal." Some little time ago he came walking into the office, and in his pompous way informed the rest, amid much laughter, that he contemplated making drawings for the Soane Medallion. From that time forward he of the swivel eye held solemn conclave with he of the red hair. The drawer which held the Whatman's paper came in for a great deal of attention, and at times the office would be short of T and set squares. Even the india-rubber flitted at times, but no one complained—a secret and silent understanding seemed to move among the members of the staff. The result is not yet known, but the committee who adjudicate upon the drawings have retired to the cemetery—at least "they say" so.

G. LL. M.

Some Exhibited Etchings.

AT Mr. Gutilemen's gallery in King Street, St. James', Mr. D. Y. Cameron's etchings have for some weeks been on view, and together with these, the very beautiful drawings of his sister, Miss Kate Cameron. With regard to the latter, we have no hesitation in saying that they are surpassingly beautiful. To see anything like them, one must visit a neighbouring Japanese gallery, for Miss Cameron is undoubtedly a devoted lover and student of Japanese water-colour drawings. It is certain that nowhere else in the world has Nature so true an interpreter as in Japan, and Miss Cameron, who would appear to be young, could have no better teacher. There is a limit of her limitations in the preceding remark, for the genius of that country is anything but conventionally decorative. It is right to ignore the third dimension when one is employed on a plane surface, but wrong to suppose that this is the only concession that the decorative artist must make to convention, for waifs and strays—mere vagrant things—cannot of themselves form a restful design. We hasten, however, to say that it is not as "designs" that Miss Cameron exhibits her drawings. It is likely that we, at some later date, shall be invited to see her knowledge of Nature "applied," as we say, to the decoration of places and things, but for the present she could not do better, and should not hasten to change her ways. Too often it happens (thanks be to the Birmingham prison) that the opposite course is pursued, and that the artist thinks first of mere space-filling, and last of drawing even tolerably. As Life is begotten by Heat, so Heat is the subject here, whilst the objects are bees and flowers. As fragrance, colour, and solacing sounds belong as of right to the beautiful things she portrays, there is a "rare concert of all delight" in each of Miss Cameron's studies, and a possible poem in most of the titles she chooses. The "Pastoral Bandits" are murmuring bees. If we have allowed but little space in which to speak of Mr. Cameron's etchings, it must not be supposed that we do not think highly of them, the fact being that it would not be easy to praise his best work beyond its deserts. To speak first of the range of the etcher within the limits prescribed by the *métier*. He would seem to have learnt in the school to draw almost to perfection either faces, figures, or buildings, and only a little later to have mastered Rembrandt's art. We must not say more than a word on the etchings in which faces and figures appear, for his work as the architects' artist engages attention at present. It would be hard to particularise, as so many are even exceedingly good, and a mere list of the works would convey no idea of the etchings themselves. Suffice it to say that in the landscapes selected there are frequent reminders of Rembrandt, and of Meryon in the etchings of architectural subjects, those of earlier date more especially. It would be impossible to pass through the room without welcoming here, although we have seen it before, Mr. Cameron's "Holyrood Castle," the most important work he has done, not merely because of its being an obviously popular etching of an imposing historical scene, but because the artist has been by the subject inspired, and has certainly never done better. It is no pupil's work, and is on all accounts splendid.

E. R.

THE Douglas Corporation has obtained authority to borrow £17,000 for new municipal buildings and public library; £5750 for the erection of a block of artisans' dwellings; and about £7000 to acquire property for the improvement of the North Quay.

ECCLESIASTICAL DOORWAYS IN CORNWALL.

BY EDMUND SEDDING.

"ECCLESIASTICAL Doorways in Cornwall" was the title of a lecture delivered by Mr. Edmund Sedding recently at the Plymouth Institution. Traces of entrances, Mr. Sedding said, were found in the most primitive habitations of man, on Dartmoor, in Scandinavia, and in Brittany, where there were no traces of windows other than the smoke hole. The earliest indications of entrances were of a rude square shape. Right through the Celtic, Syrian, and Egyptian periods the doorways were of a rectangular form, which came to be scientifically proportioned in the time of the Greek dynasty. It was this kind of entrance that was found in every dwelling-house of the present day. Roman entrances were semi-circular headed, for in their time the arch developed. There was

NO EVIDENCE OF ROMAN WORK

above ground in Cornwall, although the Roman occupation was known as far west as the Lizard, and on the north, ten miles outside Newquay, by the coins and ornaments dug up. After the Romans left this country, in 415, England was a prey to hordes of barbarians, Picts, Scots, Danes, and Saxons, who each had their turn, but left no indication of their occupation, except the Saxons. Traces of their work could be found in nearly every part of England, with the exception of Cornwall, but, no doubt, if they had been skilful builders in stone instead of wood, their work would have escaped the ravages of the humid climate. The Saxons being timber constructors, there were very few walls of Saxon workmanship remaining, but their form of construction could be seen in the little church at Ongar, in Essex, which shows a range of trunks of trees placed in juxtaposition, with the inside simply plastered. Being subject to incursions from the northern tribes, the Saxons erected towers as places of refuge, and it was by these that their Architecture was best known. The little church at Monks Wearmouth was a typical example. Referring to the effect of Norman work, Mr. Sedding said he considered it was very

LUCKY FOR ENGLISH ARCHITECTURE

that the country was invaded by the Normans, who were splendid stone constructors, and found in the mean Saxon edifices a stimulant to erect ones of much nobler proportions. In Cornwall Norman doorways were to be found at St. German's, Mylor, St. Cleer, and St. Martin's, Looe, but they only ranked third rate. There were very few examples of first pointed work in Cornwall, and all ornate workmanship was very simple, no doubt owing to the hard materials they had to deal with. There were also few specimens of the succeeding style, but good examples were to be seen at Lostwithiel and Egloskayle, the west door of which was of catacluse stone in splendid preservation. Two snakes were worked into the mouldings of the jambs, the head forming the capital of one, and the tail the capital on the other side. The body formed a bold shaft moulding. Out of 200 old churches in Cornwall no less than 180 were examples of the Perpendicular period. Some were very bold and effective, particularly those at Saltash, St. Keverne, and St. Cleer. It was curious to note that granite was hardly ever used with much skill until the fifteenth century, sandstone and other local stones being the materials used. The Normans always worked in freestone. The lecturer pointed out that the idea of the work in Cornwall was entirely different to that of the churches of the North and Midlands. There were only three churches in Cornwall with frescoes, Fowey and Lostwithiel being included. Mr. Sedding concluded by expressing the desire that some society would endeavour to save the old buildings. He reminded them that the old buildings were entirely dependent upon their care and vigilance in watching and restraining the destroying process.

THE CONSTRUCTION OF FIVE FAMOUS DOMES.

BY JOHN MARSHALL.

NO. III.—THE DOME OF ST. PETER'S, ROME.

A PERIOD of over 100 years elapsed between the completion of the dome of the Duomo, at Florence, and the commencement of that of St. Peter's; yet the latter is the next, of any considerable importance, in the order of succession.

While possessing many features in common, these two domes are, in several respects, very dissimilar, the splendid resources of the Renaissance having, in St. Peter's, contributed towards a grandeur of effect hitherto unattainable.

In plan, the supporting structure may be described as a compromise between that of Sta. Sophia and that of the Duomo. The piers, which rise from the angles of a square, are so shaped as to give to the central area the form of an irregular octagon, the shorter sides of which are occupied by the piers, while the four longer, each measuring 75ft., are open to the main extensions. By this concentration, so to speak, of the supports in four exceptionally massive piers, all the advantages of the octagonal plan are secured without that contraction of the openings which, as in the Duomo, cannot but be regarded as a serious defect.

Each of the piers is, roughly speaking, 60ft. square on plan, and occupies the vast area of over 3100 square feet, the aggregate being equal to nearly one-third of the total area of the central compartment. The openings are spanned, at the height of 110ft., by semi-circular barrel vaults, 28ft. in depth, which receive, and derive abutment from, the vaulting of the adjoining extensions.

Thus far the arrangement presents nothing strikingly novel; but from this stage is made a departure, so bold and aspiring, as almost to result in the realisation of the proud boast of Michael Angelo that he would "raise the Pantheon in the air."

When treating of the great Florentine dome, it was pointed out that, springing from an octagon, it is, consequently, deficient in some important structural qualities which exist in a dome of circular plan. In St. Peter's, where also the plan of the substructure is octagonal, these qualities are imparted by the introduction of the pendentives, not at the base of the dome, but at the base of the drum, at which level the circular plan is developed. In the pendentive itself, as it exists in Sta. Sophia and in St. Peter's, respectively, an important difference must be noted. In the former, where the weight is small in comparison, the pendentive, rising from the actual internal angle of a square, springs from a mere point, and is brought forward to such an extent that no portion of the dome is directly over the piers; but in St. Peter's, where the weight of the superstructure alone exceeds that of the whole of the Pantheon, it was found necessary to bring the supports more directly under the weight. This has been effected by filling in that portion of the piers where would, otherwise, have been the internal angles of the square, and thus actually advancing the supports beneath the superstructure. Under this arrangement the pendentives have but little weight to sustain, and may be aptly described as a corbelling over of the shorter sides of the octagon, but with a curve so slight as to be hardly perceptible.

At the level of the plane of the circle developed by the pendentives, and at the height of 160ft. from the floor, the structure assumes, on the exterior, the form of an octagonal platform, whence rises the first stage of the superstructure. This consists of a circular basement, plain and massive, rising to the height of 37ft., and having an external diameter equal to that of the Pantheon. The immense thickness of its wall—28ft.—aids in

the distribution of the superincumbent weight; while a continuous vaulted corridor, 7ft. wide, and communicating with the several galleries and staircases, is formed in its thickness. A peculiarity to be noted in this corridor is the numerous inclinations in the floor, which are occasioned by the upper rims of the supporting vaults.

The prevailing character of the next stage is one of great lightness, the skilful disposition of material producing an effect most

pierced with a continuous range of windows without entailing any loss of strength.

Yet, notwithstanding the advantages, artistic and structural, accruing from the presence of the peristyle, it has introduced into the dome one serious element of weakness. This is seen in the fact that it is unavoidably limited, at its springing, to a thickness utterly inadequate to withstand the bursting pressure of the lantern. The evil is greatly aggravated by raising the wall of the drum some 15ft. higher than the peristyle, and also

ST. PETER'S - ROME -

elegant and artistic. Instead of the wall being carried up a solid mass of sufficient thickness in itself to resist the thrust of the dome, as in the Duomo, it is kept comparatively thin, and supplemented by the peristyle. This consists of thirty-two columns, disposed in sixteen couples, placed at equal distances round the wall, with which they are connected by solid masonry for the purpose of abutment. The presence of these ornamental counterforts also admits of the wall of the drum being

by adopting for the dome a section but little removed from the hemispherical—the radius drawn to the vertex of the inner vault making, with the vertical, an angle of only 12deg. An endeavour to defeat the crushing weight of the lantern is made by increasing the total thickness toward the crown. Yet, though this gives to the dome greater power of resistance at the summit, the weight is increased precisely where it should, if possible have been reduced.

The height from the floor of the church to the springing of the dome is 246ft., and the internal diameter, at this level, is 137ft. 6in., or only 1ft. less than that of the great dome at Florence. The cellular system of construction in both is similar. But, as just intimated, the two vaults are not concentric, the total thickness gradually increasing from 9ft. at the springing to 14ft. at the crown. For this disparity, some compensation is obtained by building the shell solid to a point about 20deg. from the springing. At this level the inner vault has a thickness of 6ft., the outer of about 2ft. 9in., the thickness of both slightly diminishing in the ascent. The plan being circular, the system of converging ribs, or counterforts, by which the inner vault is strengthened, is less complicated than is the case in the Duomo.

The sixteen ribs are of stone, and rising from the level of the springing of the inner vault, are reduced considerably in width by a series of abrupt breaks, so as to limit the weight towards the summit, where they terminate at the corridor round the central eye, and receive the platform for the lantern. The two vaults are of brick, not laid in radiating courses, as at Florence, but herring-bone wise.

In St. Peter's, as in most other domes built of brick, an outer covering of metal has been deemed expedient, though it cannot be denied that a facing of stone would have been more in keeping with its structural character, and also productive of a much finer effect. The grandeur of the design is still further impaired by the numerous small openings in the outer shell, which light and ventilate the internal spaces.

The lantern, which is almost wholly built of stone, may be regarded as a miniature counterpart of the work below. Its internal diameter is 23ft., and its height to the top of the cupola 40ft. The conical roof, which is of brick, faced with stone, supports a metal ball and cross, which complete the structure at the height from the floor of 437ft.

From what has gone before it will have been gathered that the constituent qualities of the dome of St. Peter's are sufficient for its own stability only, and that to render it equal to the task of supporting the lantern, recourse must be had to some extraneous aid. The only appliance available in this emergency was the tie, and it is here applied to an extent beyond all precedent, and even now, perhaps, without parallel. Both as a means of counteracting thrust, and in respect of durability, the tie is, of course, far inferior to a substantial abutment, and can, at the best, only be regarded as a poor substitute for structural strength; yet it possesses one great merit—it can be applied exactly at the part where it is most needed, and that without making any appreciable addition to the weight of the fabric.

Round the inner vault of St. Peter's were originally inserted four iron ties—two near the level of separation, about the weakest part; one between these and the springing; and the fourth not far from the summit. But about 140 years after the erection of the lantern, the occurrence of serious fractures in the dome showed the need of further precautions, and six additional ties were inserted—one round the basement story; another a little above the peristyle; and four at different heights round the exterior of the dome. It should be mentioned that the fractures were not wholly due to the pressure of the lantern, the cause being shared in by disturbance of the substructure.

Thus, unlike the Florentine dome, which possesses, in the nature of its own construction, an independent strength adequate to all requirements, and whose single tie was inserted more as a prudent precaution, than as an absolute necessity, the security of St. Peter's is literally dependent on the tenacity of iron chains.

The fact of the outer vault being turned at a higher pitch than the inner, seems suggestive of what has since come to be recognised as a condition essential to the dome, i.e., the complete separation of the two vaults.

Yet, though falling short of a perfect solution of all the difficulties involved, the dome of St.

Peter's does, undoubtedly, mark a decided advance towards success; and its architectural treatment has served, preferably, as a model for nearly all the more important domes of later times.

HISTORICAL SKETCH.—The dome of St. Peter's is the result of the successive labours of several architects. The church was commenced A.D. 1506, from the designs, and under the superintendence, of Bramante, who conceived the idea of erecting the dome in the position it now occupies; with whom also originated the further idea of applying the peristyle to the dome. The four main piers, and the arches which spring from them, were the only portions completed at the time of his death, A.D. 1514. As successors to Bramante, Leo X. appointed Giuliano da San Gallo, Raphael d'Urbino, and Giocondo da Verona; but, in a short time, the whole devolved on Raphael, who was, however, assisted by Antonio da San Gallo; but, beyond strengthening the four piers, they did but little, in their joint capacity, to advance the work. The death of Raphael, in 1520, led to the promotion of his assistant; who, having sole and undisputed control, repudiated the designs of his predecessors, and prepared an elaborate model,

embodying his own ideas for the whole edifice. Want of funds caused a further delay; and when, in the year 1546, and the Pontificate of Paul III., San Gallo died, Michael Angelo Buonarroti was called upon to carry on the work. Discarding, in turn, the pretentious design of his predecessor, he prepared one of more modest character, on the plan of the Greek Cross, but retaining, and giving greater mass to, the piers *in situ*. His design being approved by the Pope, the work was resumed; and, notwithstanding many interruptions and delays, it progressed until, in the year 1559, and the reign of Pope Pius IV., it was advanced to the base of the cupola. A model of the dome, in clay, was prepared by Michael Angelo, and afterward more carefully repeated in wood; and it is to his genius that the main portions of the existing structure must be credited. When, in 1585, Pope Sixtus V. appointed Giacomo della Porta and Domenico Fontana to complete the work, the erection of the dome was proceeded with, and Michael Angelo's original design carried out with but little alteration.

The lantern was erected from a design prepared by Vignola, who had been appointed architect in 1564.

MEDIAEVAL CHURCH BUILDERS.

THE 200th anniversary of the opening of St. Paul's Cathedral, recently celebrated, has a very general interest, as being a noteworthy landmark in that wonderful historic vista of great churches, abbeys, and the religious houses built by the masons of the mediæval guilds, which constitute at once the most momentous achievement, and the most sacred heritage, of the human race. The first stone of the new St. Paul's was laid by Wren on June 21st, 1675, without any public ceremony; the highest stone in the lantern was fixed with full masonic honours. Old St. Paul's stood on the site of

A TEMPLE DEDICATED TO DIANA,

which was destroyed and rebuilt; and it is probable that its foundation-stone was laid with masonic ritual by the "collegium," or guild, of the Roman builders who erected it. After certain ceremonies of dedication the stone, previously suspended by rope and pulley above its destined position, was let down into its place by the prætor, assisted by the chief magistrates and priests, where it was secured by wedges of virgin gold or silver. The operation being concluded, the aruspex came forward and said, in a loud voice: "Let not this work be unhallowed by the conversion of this stone or gold to any other use." But whatever the origin of modern, or, as it is often called, "speculative" masonry, there is no doubt, the Globe remarks, that the true operative masons can claim an historic continuity with their Greek and Roman predecessors. The Greek temples were the work of architects in association with organised fraternities of workmen, and the chief

PUBLIC BUILDINGS OF THE ROMANS

were erected in the same way. One of the earliest memorials of the Roman dominion in England is a stone found at Chichester in 1725, on which was the dedicatory inscription of a local temple to Minerva and Neptune by the "College of Masons." These associations existed probably for much the same reason as the "guilds" which succeeded them; that is, for the consolidation of their trade interests and the preservation of their trade "mysteries." The masons' guilds were not organically different from those of the other crafts, but they soon developed an importance from the special nature and circumstances of their constitution. The ordinary artisan performed his work in his own town or city, and not seldom in his own dwelling; but a great cathedral or priory could only be erected on its site by many long years of labour. Thus, the men had to come from afar to their work, round which many spent their whole lives. Charlemagne invited artificers from every country in Europe to build his

MAGNIFICENT CHURCH AT AIX-LA-CHAPELLE.

The German operative masons attributed their first organisation to the building of Strasburg Cathedral, in which their original statutes are preserved. The building of the cathedral at Cologne led to a similar result, and "colleges" of masons were formed in both cities. The Scotch operative masons date their embodiment from the completion of the Abbey of Kilwinning, about 1150; and the chapels of Roslyn and Holyrood, and the abbeys of Melrose and Kelso, are among the many monuments of their skill. Foreign masons owed their first introduction into England to Wilfrid, Archbishop of York, who employed them in 674 to build the church at Hexham. Many of these men were "taken on" by Benedict Bishop for his new abbey at Weremouth; and he also went to France for "stone-workers, able to build his church of stone, after the Roman manner." Before this period our ecclesiastical buildings had been chiefly constructed of wood, and even when King Alfred began to restore and rebuild them, in the ninth century, he had to send abroad for the necessary masons. These early workers were chiefly employed in the North of England, keeping themselves distinct from other artificers, and preserving their trade secrets

from outsiders by means of secret signs and tokens, revealed alone to the initiated. The introduction by the Normans of their own style of Architecture naturally involved the employment of the only skilled labour that could give it effect. When rebuilding the choir of Canterbury Cathedral, in the twelfth century, Archbishop Lanfranc sent for the masons who had had experience on the great churches at Caen. Chief among these was the famous William, of Sens, the first known "master mason" in England, he being succeeded by "William, the Englishman," who had probably worked under him. Gundulf, Bishop of Rochester, who was also a Norman architect, resorted to the same field for the building of Rochester Castle and Cathedral. During the thirteenth and fourteenth centuries, a large number of

ECCLIASTICAL STRUCTURES

of all kinds were erected, including several of the colleges at Oxford and Cambridge. In Henry III.'s reign alone more than 150 abbeys,

ST. PETER'S, ROME.

priorities, and religious houses were built. By this time the European masons had become numerous and powerful bodies, composed chiefly of Italians, Greeks, French, Germans, and Flemings. Several privileges were granted them by the Popes, such as the right of fixing their own prices, of taking apprentices, and of admitting "accepted" masons into their corporations. Hence they style themselves "Freemasons," and presently began to claim exemption from the laws affecting common labourers. But though they were granted higher rates of wages than those of other artificers, they held no exclusive privileges in this country, and contumacious masons were amenable to the law. Soon after the restoration of Winchester Cathedral and the death of William of Wykeham, they excited the jealousy of the Government by seeking to influence the general "wages of labour," and in 1423 an Act was passed prohibiting "the

chapters and congregations of masons in tyled lodges," on pain of various penalties at the King's will. Some years later the Scotch masons also began to assume powers beyond the proper functions of their lodges, and were denounced as oppressors of the lieges because they demanded "to be paid as well for the holiday as for the work-day." The

ARCHITECTS OF THE GREAT CATHEDRALS

were not usually themselves members of the masonic fraternities. Occasionally they were laymen of skill and taste, but oftener bishops and abbots. It has been said that the honour due to the founders of many churches has been usurped by the ecclesiastics under whose patronage they rose, because the only historians were monks. But, practically, the only architects were monks too. In the Middle Ages the greatest influences emanated from the monasteries; and their heads, as a rule, were alone in possession of a sufficient knowledge of geometry and design to conceive the magnificent buildings which are their lasting monuments. We know what Carlyle Abbot Samson achieved in this direction, and even the minor question of necessary repairs had to be undertaken by him. His it was not only to rebuild the great tower of St. Edmund's, but "to change combustible decaying reed-thatch into tile or lead." And an interesting record exists showing that, some three centuries later, the then Abbot of St. Edmundsbury contracted with John Woode, master-mason, for the restoration of this same tower, "in all manner of things that belong to freemasonry." Similar records, giving the names of

THE MASTER MASONS EMPLOYED,

exist in the archives of the cathedrals of Winchester and Lincoln, of Evesham Abbey, of the chapels of Fotheringhay and St. George's, Windsor, as doubtless in those of others of the more venerable churches and minsters. Coming in numbers from all quarters, the workmen thus employed had of necessity to live in cantonments round the building in progress, and were thus thrown together even in their hours of leisure. They were under the control of the master mason, who was assisted by "wardens," and the close adhesiveness of the fraternities, or "lodges," seems to have been an almost natural result of their environment. Time tries all things; and it has proved the wonderful work of these mediæval craftsmen, and shown how "well and truly" they laid stone upon stone. There was conscience in their building, and a just pride in its result. Some of the masons were artificers of great reputation, and many a "mason's mark" upon an ancient stone shows the

SIGN-MANUAL OF UNLETTERED MEN

who have died and left no other record. They also manipulated their mortar and cement with infinite pains, leaving a saying that they should "dilute with the sweat of their brow"; that is, labour the mortar a long time, instead of drowning it with water to have done the sooner. With what result is shown by many a storied ruin, of which it is easier to break the component parts than to detach them from each other. In a bill for repairing the spire and battlements of Newark Church in 1571 is an item of 4s. 8d. for 350 eggs "to temper the lyme with." There are many and varied readings of the phrase, "the good old times"; but, at least, the men of those days knew how to design for beauty, and to build for endurance. And they did it,

THE Lancaster Town Council has approved the purchase for £30,000 of the King's Arms Hotel and estate, the latter intended for a covered produce market. Other £5000 was sanctioned for the continuation of improvements in congested thoroughfares.

COLONEL A. G. DURNFORD, R.E., has held an official inquiry at Birmingham with respect to an application by the Council for sanction to obtain loans amounting in the aggregate to £60,000, with which to carry out certain street improvements.

CARDIFF COMPETITION.

COMMENTS BY THE ASSESSOR.

IN the present issue we conclude our illustrations of the three premiated designs of the Cardiff Town Hall and Law Courts Competition. The report of the assessor, Mr. Alfred Waterhouse, R.A., was read at a recent meeting of the Town Hall Committee. In this report Mr. Waterhouse, commenting generally, says the fifty-six sets of designs submitted are "of unusual excellence, and most of them have substantially fulfilled the conditions imposed, with some little exception as to cost." On this account alone," continues Mr. Waterhouse, "I am sorry to say I have been obliged to set aside several promising designs. Out of the fifty-six I, with some

generally and their consequent spread over the surface of the ground. This, no doubt, has arisen from the ample site you had to put at your architects' disposal. In a park and among trees, buildings, no doubt, look better low rather than high; but the pursuit of lowness has its disadvantages when it prevents the concentration of departments, and I think there is danger in this direction in the present case. It shows itself in length of corridors and number of staircases and entrances."

In his "Notes" on the three premiated designs, the assessor said, with regard to No. 22, the first premiated design, that—"this design has been worked out with a thorough appreciation of the peculiarities of the site," and "for the balance of the buildings on either side of north avenue." "The elevations," added Mr. Waterhouse, "are, perhaps, somewhat stern, and they and the dome somewhat depressed under the height of the very lofty tower. The

As to No. 6 (the designs placed third in the competition), Mr. Waterhouse writes:—"There is rhythm and dignity about the elevation of the Town Hall. Indeed, in this respect it strikes me as one of the most perfect in the competition. The plan of the corridors and sanitary blocks is unexceptional. The Assize Courts block is not so satisfactory (see side elevation). The details are poor."

It may be noted that a committee of ratepayers has been formed to strenuously oppose the erection of the new municipal buildings in Cathays Park. The committee, it is understood, do not intend to oppose the purchase of Cathays Park, but simply the removal of the Town Hall from what they claim to be the centre of the town. In furtherance of this movement a memorial is being signed by many ratepayers, who believe that Cathays Park is

CARDIFF TOWN HALL AND LAW COURTS COMPETITION. THIRD PREMIAED PLANS BY MESSRS. COOKSEY AND COX.

difficulty, selected nine, as those which appeared to have realised your conditions in the most masterly way, and these, on closer consideration, were finally reduced to the requisite three. At least three out of the nine had to part company from their fellows on account of the extraordinarily low estimate put upon the work to keep within the prescribed sum. I need hardly point out to you that it would be most unusual to obtain a design by a competition of this sort which perfectly met all the requirements of the case without alteration. Having once selected a design which shows its author to be both an artist and an adept at architectural planning and design, the necessary modifications need not long delay the preparation of the working drawings nor of necessity increase the cost of the building. One feature in this competition will doubtless strike you. I allude to the lowness of the elevation of the designs

elevations are but 35ft. high to the top of the parapet and the tower 220ft. Might not the former be raised somewhat, and the latter lowered with advantage? There is a refreshing vigour about the details which are well designed: the plans also of the building are exceptionally good." After dealing with minor defects, Mr. Waterhouse says:—"The police courts are on the west and not on the north side. This is, perhaps, not in strict compliance with the letter of the conditions, but I think it complies with the spirit, as the courts are entered, as required, from the North Road."

Dealing with No. 25 (the second premiated) the assessor says:—"This is an exceedingly clever design. The buildings on either side of the North Road do not balance. There is no central tower, but two at either end of the Town Hall buildings of very beautiful and rich design." But they have their defects, and these are pointed out.

not, and will not in the future, be the most convenient site for the Town Hall.

We are informed that the partnership hitherto existing between Messrs. Wimperis and Arber has been dissolved, and that Mr. W. H. Arber, of the late firm, will continue to carry on the business at the same address, under the style of "J. T. Wimperis and Arber," as heretofore.

The multiplication of theatres and music-halls in the suburbs may be gauged from the engagements of Mr. G. R. Sprague. At the present moment he has in hand, besides Morton's new theatre at Greenwich, three Empire music-halls—one at Buxton, one at Stratford, and one at Holloway. He has also contracted for music-halls at Kennington and Notting Hill Gate, and for Mr. Wyndham's new theatre in Charing Cross Road.

A SCOTTISH BARONIAL RESIDENCE.

CAIRNBULG CASTLE may fairly be described as a fine old baronial residence. It has recently been restored at a cost of £5000. In the restoration work, Mr. Duthie, the owner, has rigidly adhered to the old lines, and the Castle, as completed afresh, is as nearly as possible a copy of the old baronial stronghold which was a conspicuous mark in the landscape of North-Eastern Buchan, three or four hundred years ago. For the last sixty years the building has decayed and tumbled down at a great rate, and when Mr. Duthie commenced the work of restoration the only

of opposing hosts that periodically overran the Buchan district, when the clan spirit was at its strongest all over the North. The north portion of the building forms the square tower or keep, and is supposed to be the oldest part of the Castle. The old walls of the tower have been retained and some of the floors strengthened, but otherwise this building has been renewed. The roof now covering the tower is in appearance a reproduction of that of the olden time. The walk round the battlements at the top of the keep has been repaired. The basement floor, or dungeon, may become a wine cellar. On the next floor above, which was the great dining-hall in the olden times, there is space for a dining-room or billiard-room. In the other flats, 'twixt the first floor and the battlements, is ample space for bed-

chimney panel of this room are cut out the following significant words: "Remove not the old landmark." Over this room is an octagonal bedroom, while above that again is placed the library, the arrangements of which are rather unique. Two rooms (in height) have been thrown into one, and only portions of the floor round the walls of the upper room have been left. The floors of these rooms are all pitch-pine and polished, and all the places are most tastefully fitted up. The old-fashioned "dog" grates or brasiers fitted into the rooms are extremely pretty. From the library there is access to the top of the round tower, from whence a promenade or walk runs round the east side of the roof, giving a pretty view of the country to the east and south. The building between the north and south

CARDIFF TOWN HALL AND LAW COURTS COMPETITION.

THIRD PREMIATED DRAWINGS BY MESSRS. COOKSEY AND COX.

part standing was the square tower or keep, and that not in a very safe condition. The oldest parts of the Castle were built and occupied by the powerful family of the Comyns (Earls of Buchan); but the exact date when the Castle was originally created has not been ascertained. It must, however, have been at a very early date, for history declares that when the Comyns were overthrown, the Castle was, in 1306, forfeited to the Crown. A description of the Castle restored is practically a description of the castle as it stood 150 years ago. The Castle was never a palatial or showy building, to which the architect or the sculptor had devoted his talent or Art, but rather a plain and sure stronghold, calculated to withstand the attacks

rooms. The old stone staircase has been replaced by a wooden spiral staircase of ninety-six steps, which runs from the ground right up to the battlements. The graceful round tower, of very much smaller dimensions than the keep, which forms the south wing of the Castle, has been restored to its original shape, and for some time at least will form an important habitable part of the Castle. While strictly conforming to the original exterior form of the buildings, Mr. Duthie has finished and furnished the interior of the Castle in a way suitable to the tastes and comforts of the age. The basement of the round tower has been converted into a cloak-room, while the room above has been utilised as a business room. Over the fireplace on the

towers is entirely new, and though the exterior follows the old form, the interior arrangements are completely modern. There are entrances to the Castle from the garden and the servants' court; but the principal entrance is from the south-east side near the round tower. This entrance is a very fine one. There is a flight of seven steps, 7½ ft. wide, of Corrennie granite, with pillars and handrails of the same material. The outer door is of teak wood, and studded with inch-headed nails. Messrs. Jenkins and Marr, Aberdeen, were the architects for the restoration, and Messrs. Brebner and Jenkins, Fraserburgh, the contractors-in-chief. The "new" Castle of Cairnbulg is already attracting considerable attention.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
January 5th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

The assessors appointed to adjudicate upon the drawings of a new cemetery for Nottingham, sent in by competitors in response to an advertisement of the Public Parks Committee, have awarded the premiums as follows:—(A) Landscape Gardening, &c.—first premium, Mr. Thomas W. Mawson, The Corbels, Windermere; second premium, Messrs. William Barron and Son, Elvaston Nurseries, Borrowash, Derby. (B) Chapels, Lodges, &c.—first premium, Mr. Arthur E. McKewan, A.R.I.B.A., and Mr. Alfred I. Dunn, A.R.I.B.A., Colmore Chambers, 1, Newall Street, Birmingham; second premium, Mr. Chas. A. Nicholson, M.A., and Mr. Hubert C. Corlette, A.R.I.B.A., 28, Theobald's Road, Gray's Inn, London. The drawings can be viewed by competitors and members of the City Council at the Guildhall, Burton Street, up to next Friday.

In the matter of commercial prosperity Art has continued, during 1897, to be affected by the depression which has been definitely felt in nearly all branches of trade. The sales at exhibitions were for the most part below the average of recent years, and commissions were by no means plentiful in the studios. As a result of the Jubilee a few painters have been busy with official portraits, or have received commands to paint commemorative compositions recording special events connected with this great national function; but as a whole the influence of the stir and excitement which prevailed during the season was quite unfavourable to the generality of artists, and tended rather to check than to encourage the readiness of buyers. Among sculptors there has been less depression. The younger men who have adapted themselves to the changed condition of the popular demand, and have set themselves to supply what is wanted in the way of decorative work, have been kept reasonably busy, and their prospects for the future seem encouraging.

ONE of the best and most promising characteristics of the past year, one that is full of excellent augury for the future, says the Globe, is the rapid development of the movement, which has of late assumed great proportions in the provinces, for providing really satisfactory facilities for the introduction of modern Art work to the public. The need for properly arranged and liberally endowed Art galleries in all the more important towns is fast becoming a definite conviction in every part of the country. The chief manufacturing centres have taken the lead in this matter, and their example is being widely followed. Considerable sums of money are being expended upon new buildings or upon the enlargement and improvement of galleries already existing; and we may fairly hope to see, before long, a general recognition of the part that works of Art are able to play in the scheme of national education. What is indispensable in a manufacturing centre is valuable everywhere else where people congregate; and it is not too much to hope that in a few years more a representative Art collection may be

regarded as no less important for a local community than a public library or a board school.

ONE of the greatest achievements in Decorative Art which can be recorded during the past year is the completion by Sir W. B. Richmond of his mosaics in the choir of St. Paul's Cathedral. This first great section of the permanent adornment of the building was finished in the spring, and, as a recognition of the importance of his work, the artist received, at the time of the Jubilee, the honour of knighthood. The success of his efforts to produce a scheme of decoration worthy of the cathedral has aroused a very general desire that he may be enabled to extend his labours to other parts of the building, and to carry to completion what he has excellently begun. Efforts are accordingly being made to raise funds sufficient to meet the cost of further decoration in the nave, transepts, and dome.

THE walls of Paris, constructed in 1840, having long ceased to be of any military utility, their demolition has been frequently

ment, £600 on heating and lighting, and £400 on choir stalls. The remainder will be apportioned as follows: Screen, £1500; sedilia and side-screen, £800; marble floor, £350; bishop's throne, £650; chapel fittings, £300; holy table, £100; and the canopied recumbent effigy of the late bishop, which is to be placed in the enlarged choir, £2500. To these must be added the cost of the memorial window in the new choir, which is to be specially subscribed for by children.

A RECENT number of the Athenæum contains a protest against the proposed alterations at Wakefield Cathedral. "Unless a timely protest is made, a very foolish piece of church tinkering," we are told, "is likely to be perpetrated. The cathedral church of Wakefield is the ancient parish church, a large, rather plain building, chiefly of the fifteenth century and later, but with nearly eight centuries of history in its walls. In the sixties and seventies it underwent 'restoration' at the hands of Sir Gilbert Scott, and chiefly through the vigilance of the late Mr. James Fowler and a few of his friends, it lost less in the

CARDIFF COMPETITION. THIRD PREMIATED DRAWINGS BY MESSRS. COOKSEY AND COX.

advocated. General Billot, Minister of War, has now submitted to the Chamber a bill for the demolition of the northern and western portion between Pantin and Point du Jour, and for the erection of a short wall, 900ft. long, further out. The old site would be sold, the estimated value being 700,000,000f., and 4,000,000f. would be devoted to the new wall, while the remainder would be expended in artillery. The Budget Committee have resolved on asking the Ministers of War and Finance for details of the scheme, and the municipality advocates the prohibition of the erection of factories on the site to be sold.

A SUM of about £2000 has been either received or promised towards the fund which is being raised for the enlargement of Wakefield Church, and for other purposes, in memory of the late bishop, Dr. Walsham How. From a report which was presented to the committee by the late Mr. J. L. Pearson, R.A., it seems that as much as £20,700 will be required, of which £13,500 is to be spent on the work of enlarge-

operation than most have done. There are some important remains of old furniture, and what Scott put in is as good of its kind and suitable to the place. Some churchwardens' additions of poor character, but relatively not important, have been put in since, and when the church was made cathedral a trumpery throne was set up. The windows have been filled with painted glass, some of which is bad, but more good, and the good has been designed on a regular scheme, which, if completed by the removal of the bad windows and the substitution of others according to the prevailing treatment, would make the church, as to its glass, one of the best for its size in England. Last year a well-intended, but feebly designed, reredos was set up, which has, at least, the merit of covering a part—unfortunately only a small part—of one of the bad windows. The church is an excellent working parish church. Its architectural condition is better than that of most town churches now, and with a little judicious pruning and some improvements in its fittings, it might be made better still."

HOUSEBREAKERS are now taking down the Church of St. Michael, Wood Street. It has transpired during the demolition of the tower that much of it belonged to the former church, which was destroyed during the great fire of London. Wren made use of a good many of the turrets which fortunately were left standing, and by that means was able to apply much of the sums voted for rebuilding purposes to internal decorations.

THERE is now scarcely a district in Greater London, north, south, east, or west, in which one cannot find an excellent theatre. The most recent addition to the already lengthy list is the New Alexandra Theatre, Stoke Newington, opened last week. It is a handsome and commodious building. The theatre has been built close to Dalston Junction, on the North London Railway, in the midst of a thickly-populated district. It stands on a capital site in the Stoke Newington-road, and the architect, Mr. Frank Matcham, has made excellent use of the opportunity afforded him. He has produced for Mr. Purcell a theatre which for suitability of design, convenience of arrangement, and beauty of ornamentation, is not surpassed by any of the numerous theatres that have been erected in the metropolis during the past few years. Externally the style of Architecture is a bold Italian, the work being executed in a dark red-brick, with stone ornamentation. The two ends are carried up with pediments filled with rich carving, under which is a deep cornice with entablature, bearing the name, "Alexandra Theatre and Opera House." In the centre of the building the elevation is somewhat lower, and is divided by columns between the windows, and having a large stone oriel window projecting from the crush-room, the whole being crowned at the top with balusters separated by pedestals containing flambeaux. But, however handsome the externals of a theatre may be, it is the comfort of the interior which most appeals to the playgoer. In this vital respect the Alexandra will satisfy the most exigent patron of the drama. The vestibule has a floor of vitreous mosaic, and the walls and staircase are executed in a very fine and highly-polished red marble.

The stairs lead directly to a large and tastefully-furnished crush room overhead, and this communicates directly with a wide corridor leading to the boxes, dress circle, and saloons. There are three entrances to the circle from the corridors, so that ample accommodation is provided. The orchestra stalls are reached by a few steps from the vestibule, and the pit, which is very commodious, and has perfect sight-lines from any position, is almost on a level with the street. The theatre has two tiers. By a convenient arrangement, the upper circle is raised at the back of the dress circle, forming the roof of the corridor, and the gallery is over the dress and upper circles. The decorations are in rich Elizabethan style, finished in cream and gold on a light copper bronze ground, with Art panels inserted on a blue ground, the whole giving a very pleasing and graceful effect. All the upholstery is in a rich dark-red velvet, which, with the strawberry and pink valences and curtains to the private boxes and stage openings, gives the interior a very cosy and agreeable appearance. There is a double installation of electric light in every part of the house, so as to prevent any risk of failure of the illumination, and the whole building, including the dressing rooms, is heated by hot-water pipes.

How to get out of a theatre is sometimes an even more urgent question than how to get in, and the architect has seen that there shall not be any difficulty in this direction. The practically isolated situation rendered this a comparatively easy task, and the whole audience of some three thousand persons, which is the estimated capacity of the building, could make their exits in a couple of minutes. But, apart from the excellence of the exits, the theatre is as fireproof as skill and forethought can make it. The auditorium is cut off from the stage by an iron curtain, the corridors and passages are provided with iron

doors, and hydrants are fitted everywhere, so that the risk has been reduced to a minimum.

ALTHOUGH there is a great deal to be said in favour of the contention, advanced by Sir William Richmond at a recent conference of the Clergy and Artists' Association, that what is known as religious Art ought to be freed from conventionality, and made more intelligible to modern people, it is questionable (says the Globe) whether the sort of realism he suggests would quite fit in with the surroundings usually assigned to church decorations. No one could dispute the suitability of instances of contemporary heroism for permanent commemoration, but whether the present-day public would accept the human-nature point of view that Sir William advocates is extremely doubtful. For one thing, tradition and association are omnipotent in the formation of what we call by courtesy the popular taste in Art; and, for another, such materials as stained glass or mosaic, which are generally used in the adornment of churches, do not lend themselves well to realism. It would be difficult to make decorations of this type convincing in these common-place days, when people concern themselves only with what is before them, and lack the imagination to appreciate subtle suggestions.

BUT if what may be called commemorative decorations were once freed from the necessity of being also religious pictures, there would be a much wider scope for the artist. In our churches it would be difficult to oust the accustomed saints and martyrs, and to substitute the heroic self-sacrifice of the Margate boatmen as a subject for illustration; but there is no reason whatever why such modern instances of devotion to the needs of humanity should not be pictorially recorded in our other public buildings. There are acres of wall-space available at the present moment for permanent pictures, and there are scores of artists who could be depended upon to cover this wall-space with thoroughly acceptable work. What is wanted is a reasonable amount of public spirit among our wealthier citizens all over the country. If they would supply the ways and means, it would not be long before every town of importance could show some artistic tribute to the courage and self-sacrifice of its greatest men.

PARLIAMENT is to be asked to give its sanction during the ensuing Session to a Bill, which has just been deposited, by which it is proposed to extend the Victoria Embankment to Lambeth Bridge, with powers to reconstruct a good deal of the adjoining neighbourhood. The works to be authorised by the Bill are:—A new street, 90ft. wide, commencing at or near the Victoria Tower of the Houses of Parliament and terminating in the Horseferry Road at a point 70 yards, or thereabouts, to the westward of the western end of Lambeth Bridge. A new street, 60ft. wide, commencing at the eastern end of Great Peter Street, Westminster, at a point opposite the north-eastern corner of the Gas Light and Coke Company's premises and terminating by a junction with street No. 1 at a point 250 yards, or thereabouts, north of Horseferry Road. A new street, 50ft. wide, commencing by a junction with street No. 2 at a point 170 yards, or thereabouts, east of the commencement thereof and terminating by a junction with Horseferry Road at a point 150 yards, or thereabouts, from the south-east corner of the property of the Gas Light and Coke Company.

A NEW STREET, 40ft. wide, commencing by a junction with street No. 1, described in the foregoing paragraph, at the south-western corner of the Victoria Tower Gardens, adjoining the Houses of Parliament, and terminating at the commencement of the embankment hereinafter described. A widening of Marsham Street on the eastern side from the eastern end of Great Peter Street to Horseferry Road. An embankment or river wall, with a roadway 40ft. wide along the foreshore of the Thames, commencing at or near the south-eastern corner of the Victoria Tower gardens, adjoining the Houses of Parliament,

and terminating at the western end of Lambeth Bridge. The Company propose to take power to stop up and discontinue for public use a number of streets and places, or some part or parts of these, in the vicinity. The capital proposed is one million, with borrowing powers. There are restrictions on displacing persons of the labouring class, and the Company may agree with the London County Council and the Vestry of the United Parish of St. Margaret and St. John, Westminster, or either of them, with respect to the construction and maintenance of certain of the proposed works, it being provided that if it be so agreed the Council shall make the proposed embankment, in which case all the powers to be conferred on the Company for making the embankment shall be transferred to and become vested in the Council.

THE General Powers Bill of the London County Council, to be considered in the next session of Parliament, contains estimates as to the amount which the Council will require to expend out of borrowed money, or money raised by the creation and issue of stock for the purposes of the Act, these estimates being as follows:—For the construction of a new street in continuation of Roehampton Street, Westminster, £5700; a widening of York Road (Battersea and Wandsworth), £87,150; a widening of the Albert Embankment (Vauxhall), £37,100; reconstruction of Rosemary Branch Bridge over the Regent's Canal, £5800, and for other purposes of the Act, including a site for the purpose of a fire brigade station at Streatham, £1200; total £137,950. The local authorities are to contribute towards the cost of the short new street in Westminster, of the widening of York Road, the reconstruction of the Rosemary Branch Bridge, and also towards the purchase of lands for an addition to Ravenscourt Park, Hammersmith, and towards the purchase of lands lying between Putney Bridge Road and the River Thames, for an open space or recreation ground, the contribution of the Wandsworth District Board towards this last purchase being fixed at £10,000. The Bill also provides for the removal of certain gates, bars, and other street obstructions in Camberwell and other parts of London.

ENCOURAGED by the London County Council, the Hackney local authorities have decided to effect a very necessary improvement at Goldsmith Row, and the reconstruction of the "Cat and Mutton" Bridge over the Regent's Canal. The total cost of the works, including a bridge 50ft. wide, will be £67,450, and the amount to be raised by the localities to be benefited is £22,494. The Hackney Vestry at first agreed to contribute £2000, but, after some correspondence on the subject, the matter has been reconsidered, and now Hackney (although the improvement will only indirectly affect the parish) has agreed to raise its contribution to £5000.

THE Antwerp Communal Council has rejected by twenty votes to seventeen the Government project, better known as the Van den Broeck, from the name of its chief supporter, for the extension of the port of Antwerp. Under this scheme it is proposed to shorten the course of the Scheldt by cutting through the bend situated seawards immediately to the north of the city, and by utilising this artificially formed section of the river for constructing docks and quays. The objections raised to this scheme are its costliness, estimated at £4,000,000 sterling, of which Antwerp would be called upon to pay a third; its difficulty of execution; the interruption of traffic during the period of construction, and the belief expressed by the burgomaster that the Government are concealing a plan for extensive military operations. The Council ultimately adopted Royer's scheme, which compromises the matter by utilising the bend of the Scheldt for docks, but leaves the natural course of the river untouched. It was also unanimously resolved to recommend the demolition of the entire fortifications surrounding the city. What effect these

resolutions may have on the action of the Government can only be matter of conjecture.

PRACTICAL training, such as can be at once turned to profitable account, is given in art and science at the Goldsmiths' Institute, New Cross. The educational work carried on under the great City Company's fostering care is of an eminently useful character, while the fees are merely nominal, the object being to attract the industrial classes of the community. There are some 400 or 500 art students who are engaged upon designs of wall-paper and for silver and other metal ornaments, and so apt are some of these learners that they earn considerable sums of money in the course of the year. During three weeks one young lady made no less than £30, while a number clear upwards of £100 a year, a ready market being found for all work showing originality of design or cleverness in execution. Students come from every part of the country to the Institute, commenced and carried on by the Goldsmiths' Company, and so far famed is its teaching that the Japanese Government has at the public cost sent over a young man to study, within its walls, the Art of designing. Nearly every subject which can be of use in a vast commercial and industrial community is taught, and during the past session there were over 10,000 tickets issued, authorising the holders to be present at classes.

THE Collins' Theatre of Varieties at Islington was recently razed to the ground, and a luxurious establishment erected in its stead. The work has been performed under the personal direction of the architect, Mr. Ernest Woodrow, who has gone so far beyond the requirements of the London County Council for ensuring the safety of the public as to provide double exits in every part of the house, thus enabling the building to be emptied in an exceedingly short space of time. No matter where the spectators are seated they can obtain an uninterrupted view of the stage, inasmuch as there is but one column at the back of the auditorium, the tiers being carried on the modern cantilever system. The auditorium itself is decorated in the Louis Quatorze style, and by the aid of delicate colouring and rich draperies the new hall is probably among the prettiest in London. Nor has comfort been forgotten, seeing that the building is lighted by the new illuminant and heated by means of hot-water radiators. The ground floor is divided into fauteuils, stalls, and pit-stalls, and all are handsomely carpeted and supplied with tip-up seats upholstered in velvet plush.

THE large hall at South Kensington Museum, where the Raphael cartoons have found a home since their removal from Hampton Court in 1865, has lately presented a strange aspect, for it is crowded with four huge canvases, upon each of which a staff of artists are at work producing copies of the great master's designs. These oil paintings, slightly reduced in size from the originals, are intended for the Cathedral of Lima, Peru, which is now undergoing restoration at the united cost of the Church, the Government, and the public, so far as the latter can be induced to subscribe towards the good work. Mr. A. A. Calderon, of the St. John's Wood Art School, was recently at Lima, and suggested to the cathedral authorities there a scheme of decoration which they subsequently adopted. This scheme included the introduction of replicas of the famous cartoons, and Mr. Calderon and his students have now half finished the four pictures to which the commission at present is limited. The subjects chosen are: (1) The Death of Ananias; (2) The Miraculous Draught of Fishes; (3) Christ's Charge to Peter; and (4) The Beautiful Gate of the Temple. It may be remembered that the original cartoons, which are coloured in distemper upon strong paper, are nearly four centuries old. They were the designs from which the tapestries now in the Vatican were worked. The colours have naturally somewhat faded, and Mr. Calderon and his assistants have admirably succeeded in representing them on the canvas in their original brightness.

THE wealthy and public-spirited citizen has another great opportunity ready for him at the Tate Gallery. No apology is necessary for insisting upon the claims of this Institution, for it deserves well of everyone who has at heart the interests of British Art. As the funds available for increasing the collection there are extremely limited, practically the only way in which important additions can be made is by presentation or bequests; and if the new rooms which will be available within the next two years are to be filled with really representative works, a good deal of widespread generosity will be necessary. Of course, this generosity must be discreet, for the mission of the Tate Gallery is to show to future generations the great achievements of the British school, and not to glorify mediocrity; but the collector who can temper liberality with discretion will find ample occupation at Millbank in supplying deficiencies which are now evident enough.

THE Metropolitan Railway Company has deposited its Bill for next session in the Private Bill Office of the House of Commons. One of its six parts takes power for the Company to work by electricity the whole of the traffic on the Company's railway, or on any part of it, including the lines owned jointly by them and the Metropolitan District Railway Company. For this purpose it is sought to erect a generating station on land adjoining the Edgware Road Station, and power is also sought to enter into agreements with the Metropolitan District Railway Company with reference to the working of both systems by electrical power.

THE ruins of the "Cour des Comptes" have remained on the Quai d'Orsay for nearly twenty-seven years as a memorial of the ravages caused by the Commune. During that time trees have found root in the debris and made the place quite a picturesque object. The place is now to be occupied by a railway station, and the carcass has been sold to the demolisher. It would appear that the beautiful frescoes of Chassériau, which were one of its chief glories, have survived in part not only the vicissitudes of fire, but of weather, and are in parts almost intact. A strong appeal has been made to Government to rescue these historical works which they had handed over to the pickaxe of the destroyer.

THE sale of the Douglas collection of old stained glass from the Château of Langenstein realised for the fifty-two lots £9000. The principal lot of three windows, from designs attributed to Holbein, was purchased by the Museum at Bâle for £1500, which acquired most of the other important pieces. A votive window, dated 1528, was acquired by certain amateurs for £1000 and presented by them to the museum at Cologne.

A SERIOUS difficulty has arisen in connection with a new post-office at Portadown. The building has been erected on a marsh on the banks of the Bann. After the officials removed to the new office the sanitary arrangements were found to be very defective, and it has at length been discovered that it is impossible to drain the premises. The result is that a dangerous nuisance has accumulated, which is very injurious to the health of the officials, and objectionable to the residents in the locality. The Board of Public Works, under whose supervision the building was erected, ignored the Town Commissioners, and refused to submit the plans for their inspection. Should the commissioners insist, as they are bound to do, on the provisions of the Sanitary and Public Health Acts being complied with, it is more than probable that another post-office will have to be erected.

AFTER various experiments with the object of improving the lighting of the National Liberal Club, it has been arranged to take down the whole of the wires in connection with the electric installation, and to replace them with new. This will mean an expenditure of something like £2000. Another improvement in contemplation is the covering in

of the terrace overlooking the Embankment Gardens, so that it can be used for dining purposes all the year round.

MR. GEORGE BYRON GORDON, the explorer, in his account of recent discoveries at Copan, says: "The most extraordinary feature that our excavations have yet brought to light is the hieroglyphic stairway. Facing the plaza at the southern end, it occupied a central position on the western side of the high pyramidal elevation that forms the northern wing of the main structure. Even in the sad state of ruin in which we behold it now, it affords a magnificent spectacle. What must it have been in the days when it was entire, and reached from the floor of the plaza to the entrance of the temple that stood on the height 100ft. above? When discovered, in 1894, this stairway was completely buried beneath the debris fallen from the temple, of which not one stone remained upon another. The upper part of the stairway itself had also been thrown from its place as if by an earthquake, and lay strewn upon the lower portion. When, at length, after months of labour, on which fifty to one hundred men were employed, the fallen material was cleared away, an acre of ground was covered with broken sculptures, removed during the progress of the work, and the lower steps were found unharmed. In the centre of the stairway, at the base, is a throne or pedestal rising to the fifth step, and projecting 8ft. in front. The design upon its face is rich in sculpture and delicate in detail. It is made up in part of handsome faces, masks, death's-heads, and scrolls, beautifully carved, and disposed with perfect symmetry, but the ensemble is perfectly unintelligible. On the face of each step in the stairway is a row of hieroglyphics, carved in medium relief, running the entire length. At intervals in the ascent the centre is occupied by a human figure of noble and commanding appearance, arrayed in splendid attire, seated on the steps. The upper parts of all these figures were broken away, but the pieces of several were recovered and restored. On each side was a solid balustrade 2ft. thick. The upper parts of these were also broken away, but by careful study and comparison, enough was recovered to enable us to make out the curious and complicated design. Portrait-like busts issuing from the jaws of grotesque monsters, standing out upon these balustrades, and repeated at regular intervals, formed their principal adornment."

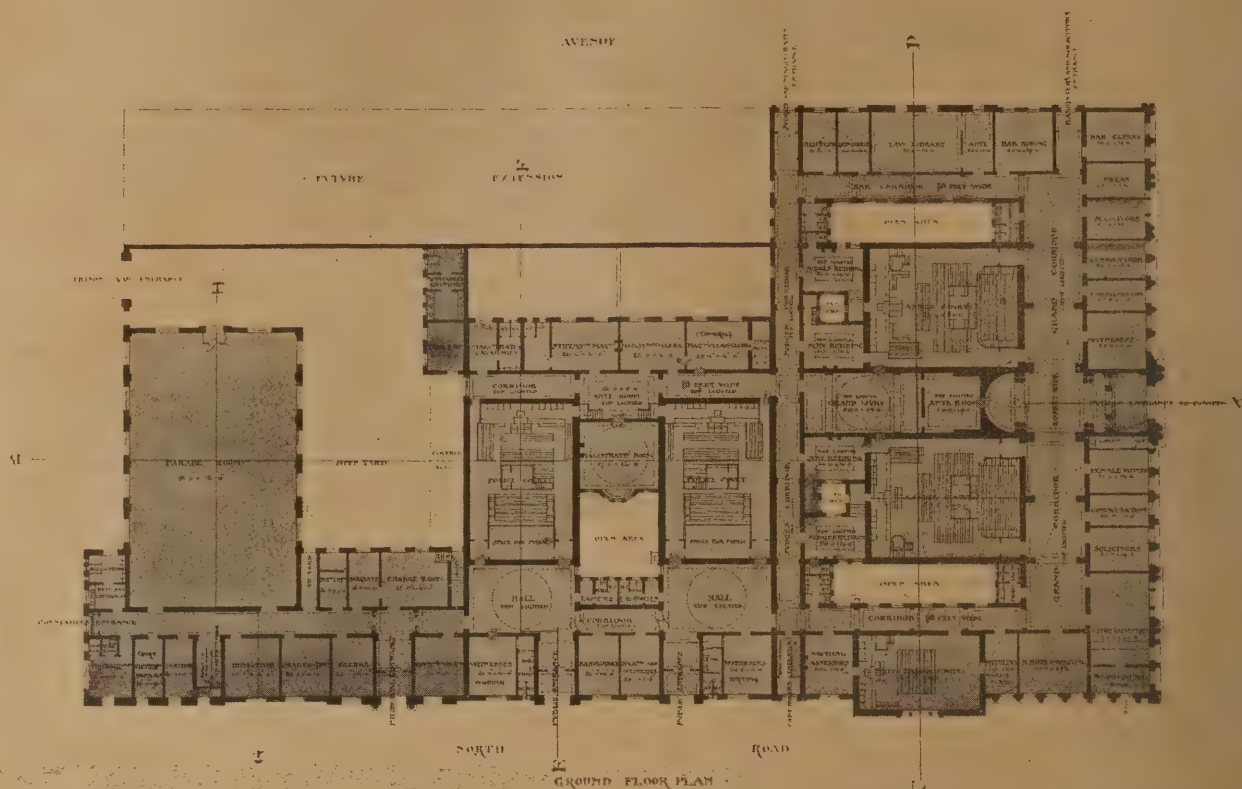

PARISIAN antiquarians are up in arms against a project which has been put forward for constructing a short railway between the Mont St. Michel and the mainland of Normandy. The mount is an isolated rock 160ft. high, standing at the end of the bay of St. Michel, and connected with the mainland by a causeway of sand, which is submerged at high tide. It is feared that, if the proposed improvement is carried out, the splendid mediæval abbey and fortifications on the rock will suffer irretrievably. The Minister of Fine Arts, however, has no official knowledge of the project, into which a local inquiry has been opened.

A BILL "for incorporating the City and Brixton Railway Company, and for empowering them to construct an underground railway from the City and South London Railway to Brixton Hill," has been deposited at the Private Bill Office. The proposed railway, which will be nearly 3½ miles in length, will start by a junction with the City and South London line under the High Street, Borough, and will terminate under Brixton Hill. It is proposed to widen the City and South London line near London Bridge Station, and also to construct a subway connecting with the Kennington Oval Station of that line. The time sought for the completion of the works is five years.

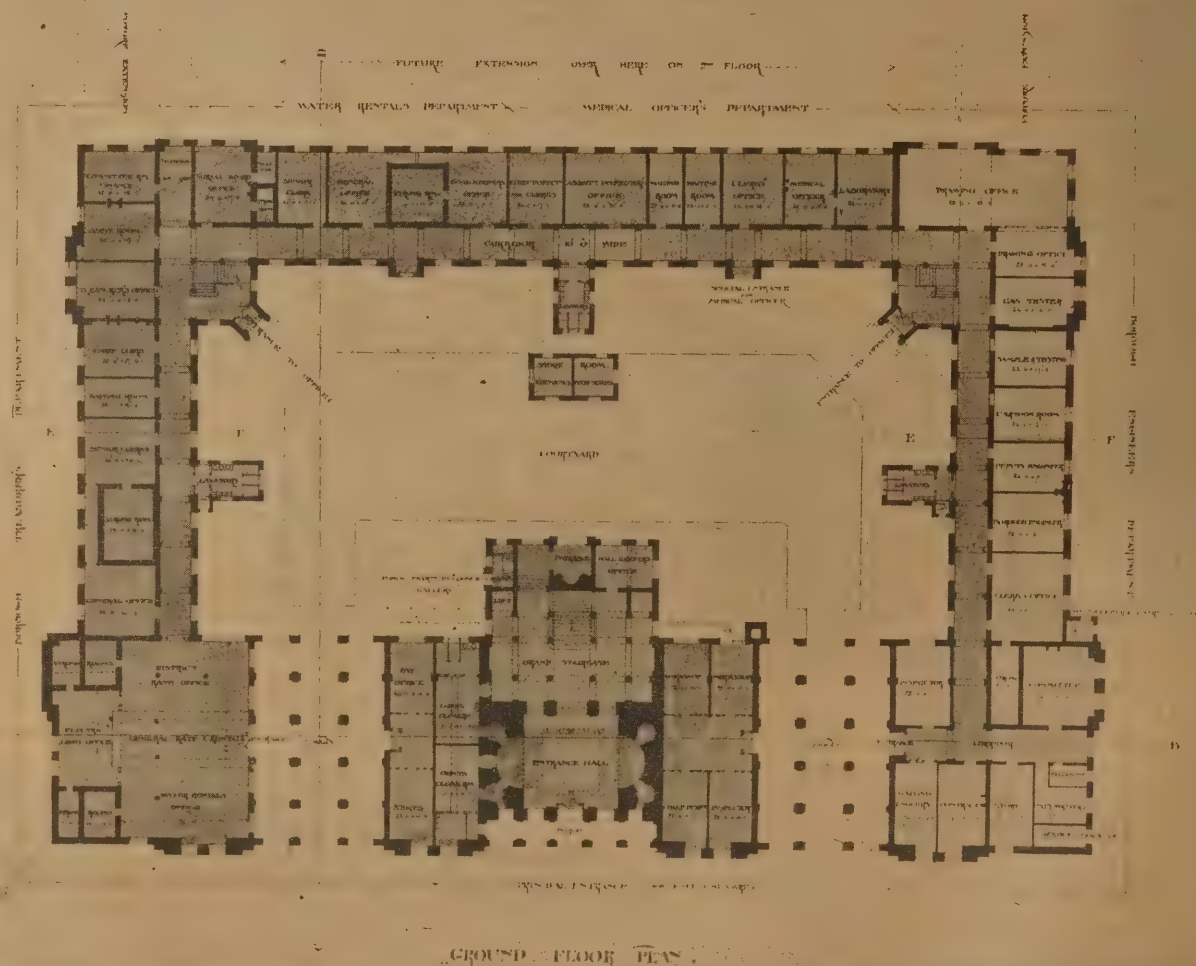

SIR ARTHUR BLOMFIELD, the assessor in the Southend Church Competition, has awarded the first place to the design of Messrs. Nicholson and Corlette, 28, Theobald's Road, Gray's Inn Road, London, who are to proceed with the work as soon as possible.

A YEAR'S BUILDING OPERATIONS.

IN MANCHESTER.

THERE has been a large amount of building in and around Manchester during 1897. Warehouses and shops to take the place of former structures of the kind which have been pulled down have been erected in considerable numbers, and the tendency to employ iron wherever possible, and, to a certain extent, glass, has made further progress. The building of cottage property on a large scale has continued, but it has been less profitable to those engaged in it than could have been desired. There is a growing tendency towards specialism observable in the letting and accepting of contracts, it being often customary to give one firm the brickwork only, another the carpentering, and a third the decorative work. The demand for bricks of the Ruabon type, which has for several years been active on account of the superiority of this material in withstanding the taint of a smoky atmosphere, has shown no sign of abatement; but the production of bricks of this class in other localities—notably in Accrington—has obviated any scarcity in the supply such as has been experienced in former periods.

IN LEEDS.

The building trade of Leeds and district has been brisker during the past twelve months than for many years. The supply of materials and labour has fallen considerably short of the demand. Owing to the stoppage of work for about twenty-two weeks in 1896, occasioned by the bricklayers' and labourers' strike, business had not regained its normal condition at the beginning of last year—a fact which, combined with the great increase of building work at the same period, placed serious obstacles in the way of contractors making satisfactory progress with the works under their charge. Employers have experienced much difficulty in obtaining a sufficient number of good skilled workmen to keep pace with the contracts offered to them, and in some instances they have been compelled to decline contracts on account of the expense of and delay in obtaining labour and necessary materials. Brickmaking firms and stone quarry masters have failed to meet the large demands made upon them. The standard price of bricks has not been altered by any general combination of makers, though firms have been able to make their own special terms, and to sell to their best customers at advanced rates. The latter have readily agreed to the demand in the hope of securing a fair share of the limited output. The demand for fine clay goods and glazed bricks has also been good. The Leeds quarry owners have been unable to meet the demand for outside building dimension stone, and in numerous cases serious delay has resulted. Local quarries have become fewer in number, and the average output much reduced. This naturally

HAMPERS THE PROGRESS OF BUILDINGS for which stone is freely employed, and may possibly tend to induce architects and builders to seek stone in other districts. On the other hand, the scarcity of skilled masons' labour, and the serious cost of stone and carriage from a distance, may tempt them to use moulded brickwork, terra-cotta, granite, or similar facings more generally than at present. Some of these materials are now being considerably employed in many of the important buildings in the centre of the city. There have been no strikes during the year, but minor differences as to working regulations seem to be a frequent source of complaint. A case of this kind has happened within the last few weeks. A certain firm having allowed a foreman bricklayer in their employ to set a few dressed stones in a building under his supervision, all the masons in their employ were drawn out without notice, and a fine of £15 imposed by the Union upon the firm. The Master Builders' Association took the matter up, and deputations met and discussed the various points of difference, with the result that the men re-

turned to work. For a space of three weeks, however, the firm in question had to suffer a complete cessation of masons' work on hand, causing great inconvenience, which was especially felt by customers. It is to be hoped that such an extreme course may not again be resorted to in regard to comparatively small matters of difference, but that the parties may meet and consider in a reasonable way the points at issue between them. The Corporation have shown considerable enterprise by the vigorous way in which they have taken in hand the improvement of many important streets. Great progress has been made during the year; some of the surplus lands have been disposed of, and much more is expected to be done during the next twelve months. The Leeds Estate Company are making rapid progress with the development of their sites in Briggate and Vicar Lane, and the present general favourable circumstances would seem to indicate a large and busy trade for the builders of Leeds this year.

IN HULL.

The building trade in Hull during the past year has been exceedingly brisk. Several mills, principally for the flour trade, have been built on the east bank of the River Hull, and judging by those already erected, and others contemplated, Hull will soon be one of the largest building centres in the kingdom. A very large number of houses have been built in both East and West Hull, but the only large building erected of importance, apart from the mills, is the new Palace Theatre, on the Anlaby Road, at a cost of £50,000.

IN SHEFFIELD.

In no previous year has the Sheffield builders been busier than in 1897. In every part of the suburbs dozens of new houses have made their appearance, and in the centre of the city, too, several new and extensive premises have been erected. The average number of newly-erected houses certified as fit for human habitation each twelve months has for the past few years in Sheffield been about 1000, but last year no less than 1426 houses have been passed by the authorities.

THE NUMBER OF PLANS

submitted for approval for houses, salesshops and property of every description has been 1429, and the number of houses sanctioned in the plans has been 2320, while 480 other proposed buildings have been approved. In addition to these figures we may further state that 50 more houses have been completed, but for various reasons have not been certified, and the total number of other buildings completed during the year has been 218. Comparing these figures with those of previous years it is found that the builders and contractors in the town have been unusually busy. Under these circumstances, therefore, it naturally follows that the cost of private house building has been increased, but notwithstanding this, new houses have sprung up all over the outskirts of the city. The district in which, of late, most of the new houses have been erected is perhaps Abbeydale, and here almost every available yard of land has been utilised for building purposes. Meersbrook, though not coming within the city boundaries, has

GREATLY INCREASED IN SIZE

of late. After these two districts come Firvale, Stanforth Road, Darnall, and Hunter's Bar. Coming more into the centre of the town, new buildings are making their appearance almost as rapidly as in the suburbs. In Pinstone Street the principal new block which has been finished during the year is that of the Prudential Insurance Company. The block has done much to increase the architectural beauty of the thoroughfare. The Commercial Union Buildings Company is also erecting somewhat extensive premises at the corner of Pinstone Street and Charles Street. These adjoin those of the Prudential Company, and when finished will about complete the building operations from the Moorhead to St. Paul's. The School Board has completed one or two Board schools, and the guardians have opened a block of cottage homes.

GREAT ART WORKERS OF THE CENTURIES.

ANDRÉ CHARLES BOULE.—ARTIST-IN-LAYER.

THE devices by means of which artistic and decorative effects are produced are very varied. Amongst these, one of the most obvious must have been the juxtaposition of portions of variously coloured material in such a manner as to produce an ornamental design applicable to the decoration of a more or less plane surface. Doubtless the initial form of this work was the large and rough idea of paving a palace or temple floor with a layer composed of square or some other geometrically shaped slabs of parti-coloured marbles or stones. Hence originated that species of pavement to which the term "tessellated" is applied, a method largely adopted by the Romans, and by them borrowed from the Greeks. There are now extant remains of this "mosaic work" of Greek manufacture, and we know that the Latin term for the earliest Roman examples of it, *lithostrotum*, was derived from the Greek word *λιθοστρωτον*, which declares plainly the Greek derivation. The Romans had several forms of this mosaic pavement, all formed by placing small cubes of stone, marble, terra-cotta, pottery, or even glass, termed *tesserae*, together, so as to form more or less intricate designs. A specimen of the more pictorial style of inlay of this kind was found at Cirencester some time since, representing a head of the goddess Flora, which shows much colour. The flowers are principally of a bright ruby red, produced by *tesserae* of glass. The leaves and stems are of a dull olive green. One or two white flowers are introduced in the dark chocolate-coloured hair. The swallow on Flora's shoulder is simply black and white with one line of grey.

From this mosaic work there was a connecting link between it and the wood inlay of Boule, and this work was termed *intarsiatura*. The Art itself sprang up in Italy during the middle ages. It consists in forming decorative designs by the junction of small cubes of different coloured woods. At first only the natural colours of the different timbers were depended upon, but the later intarsiaturalists stained their woods when necessary. Some of these wood pictures display the utmost finish and delicacy, and are models of patient workmanship. At first nothing beyond decorative designs were attempted, but, later on, the intarsiaturalists, like the Roman mosaicists, aspired to become pictorial artists, and produced veritable pictures. Many of these productions outliving the centuries, frail as they are, are still extant in Italy. Some very fine examples are to be found in the Church of Santa Maria-in-Organo in Verona, which were executed by Fra Giovanni da Verona, a white Benedictine of the Brothers of Monte Oliveto.

Fra Giovanni da Verona died in 1490. His portrait, by Francesco Morone, in the quaint white hood of his order, hangs in the sacristy. Quitting, however, Italy, we find that the Italian school of *intarsiatura* workers were followed into France by a school of inlayers in wood. As in decorative Art and Architecture, we know that the French Renaissance was the offspring of that of Italy, and that Francis I. induced many Italian artists and *ouvriers* to come to his dominions, notably the great Leonardo da Vinci and the celebrated Benvenuto Cellini. The men of the French school of inlayers did not attempt to produce wall and other pictures built up of minute pieces of wood like the Italians, but they covered the surface of furniture with ornamental woods cut into very thin veneers. Very often they formed designs of different coloured woods, in this manner quite equal to *intarsiatura*, and more readily produced. If necessary the wood was stained, to produce tints not found in Nature, and shadows were produced by holding hot irons or heated sand over a piece of light coloured wood until the heat darkened it. These thin films of wood were glued to the table or other article, precisely as a modern English cabinet-maker

proceeds in veneering. The French term for this Art of inlay is "marquetry," and numerous artists of the greatest excellence and skill practised the Art as applied to the decoration of furniture, from the fifteenth century onwards. The layer of ornamental wood which they applied to any surface, for example, a table top, was very thin—in fact, what we now call "veneer," and applied with glue. Many persons who have not given the subject much consideration are both struck and puzzled on examining a choice example of marquetry. Here is perhaps a large surface of some light colour, such as satinwood, on which is inlaid a most elaborate and intricate pattern in some darker coloured wood. The lines of the design are of marvellous delicacy, yet so carefully are they cut, and so neatly inserted in the ground, that the lines of juncture are almost imperceptible. The manner in which these patterns of inlay are produced may be popularly explained by supposing a very simple marquetry design, say a black star on a light ground, is required to be produced. Two pieces of veneer, one of light wood and one of ebony, are taken and glued together with a piece of paper intervening. A small hole is then drilled somewhere, and the blade of a very fine buhl saw inserted. Next the lines of the design are very carefully sawn round. The glue is then softened and the layers of veneer taken apart. The workman has then a light coloured ground and a black star, and also a black ground and a white star. Thus, when these veneers are properly glued on to the surface intended to receive them, a couple of marquetry designs are secured.

The merit of André Charles Boule as an inlayer is that he enlarged the artistic sphere of the Art by calling in the aid of thin brass as an ornamental material, and produced innumerable designs of the highest merit, composed of lines of brass, inlaid in a ground of wood, generally of a dark colour. This description of ornament is generally termed boule (or buhl) work, in honour of its inventor, the second spelling being that generally, and incorrectly, adopted in England.

André Charles Boule was born at Paris in 1642, and died in the year 1732. He elevated the Art of inlaying—which the French term "marquetry" or "ebenistry"—to the rank of a fine Art, and acquired a great reputation for his furniture, enriched with ornamentation in bronze, in mosaic, and with decorations in gold, copper, ivory, and tortoiseshell, all of which inlaid specimens are known as buhl work at the present time. By his happy selection of the woods of India and Brazil, which he arranged with the utmost skill, and by his employment of ivory and copper, which he cut like a true artist, he was able to imitate in his furniture all kinds of animals, flowers, and fruits, though his work is difficult of pictorial illustration. He even went so far as to represent historical subjects, as landscapes, hunting scenes, and even battle pieces. Louis XIV., who was sufficiently appreciative to comprehend Boule's genius, granted him apartments in the Palace, and named him "Engraver of the Royal Seals." Besides this last appointment, Boule received, in the *brevet* of appointments delivered to him, the titles of "architect, painter, sculptor in mosaic, artist-inlayer, chiseller, marquetist, and inventor of figures." In fact, he did actually unite, more or less, all these qualifications in his own person. This enabled him to produce in the highest degree of artistic perfection the furniture, clocks, wardrobes, *escritoires* writing desks, &c., which issued from his workshops. Boule worked for Versailles and the other royal residences, and received numerous commissions from several foreign sovereigns. It is said that upon one occasion, when the *ébéniste* (as Boule was generally termed, from his frequent use of ebony for the groundwork of his designs in ivory, brass, and mother-of-pearl) was waiting upon Louis Quatorze at the palace, the King took him to a private cabinet to show Boule a very fine and beautiful specimen of ancient Roman mosaic, which had been acquired for him in Italy. It is well known that, although his intercourse with strangers was characterised by extreme hauteur, *le grand*

monarque, in the privacy of *la vie intime*, was a man of great geniality. "André, mon ami!" said the monarch, surveying the mosaic with rapture, "didst ever see a thing so perfect—such a consummate *chef d'œuvre*? Wouldst thou have believed that it had been possible for mortal man to have so deftly arranged countless morsels of stone and pottery as to make a picture so exquisite?"

"Yes, *monseigneur*," responded the artist, "I can very readily understand it. The man who made that mosaic was undoubtedly a cunning workman, and I would that he walked God's earth to-day that I might cross palms with him. I suppose you and the world generally would call him a genius. *Chut! la patience est la génie!* That man had an indomitable patience; so have I, your majesty's humble *ébéniste*. I work in wood rather than in marble, stone, and potsherds. If your majesty will permit me to make a slight sketch of this work, I will undertake in a few weeks to bring you a table, the wooden inlaid top of which shall be a perfect *fac-simile* of that mosaic."

And Boule kept his word.

At the South Kensington Museum are several fine specimens of Boule's work, belonging respectively to the Queen, the Duke of Buccleuch, and the Duke of Hamilton; and the late Sir Richard Wallace exhibited some fine specimens from the Hertford Collection at Bethnal Green in 1872.

It may here be observed that the earliest artist workers of the French Renaissance were very fond of interlaced strapwork ornaments. In earlier days—those of Henri Deux and the fair Diane de Poitiers—we find the strapwork patterns in that rare and precious porcelain known to collectors as Henri Deux ware, and on the sides of the splendidly bound volumes of Jean Grolier, Henry's minister, we find the same kind of interlacing patterns. It was not, however, generally popular in the reign of Louis XIV., and the specimens of Boule's work so treated must be considered simply as a survival or a copy of some earlier work.

There are several technical points about the marquetry which adorns the furniture made by Boule in the seventeenth century, and that constructed by his followers, Riesener and Daird, in the following century, worthy of note.

The former was an *intarsia*, or surface inlay of various materials, principally tortoise-shell, with brass and white metal, the surface of the latter being occasionally enamelled in various colours. This work was afterwards enhanced by the laying of metal beneath the tortoise-shell to add to its colours. The two manufactures are usually called "old" and "new" Boule.

The shell generally used was that of the marine tortoise, called *testudo imbricata*; or hawk's bill turtle, and was prepared by dipping into hot water and subjecting to various processes.

In obtaining the patterns of Boule work a couple of thicknesses of the materials to be used are cemented together with a sheet of paper interposed, another sheet of paper being glued on the outer surface, upon which the design is drawn. The lines of the latter are then carefully cut round with a Boule or fret-saw. Afterwards, by the application of heat, the glue which cemented the two layers of material was softened and the two slices separated. Of course, then the pattern cut out of one slice fitted into the groundwork of the other, so that one operation of the saw produced two copies of the design. Thus, if the design were a Grecian lyre, and the material satinwood and ebony, the artist would have a lyre in light coloured wood to inlay on a black ground, and an ebony lyre to insert on a ground of light coloured wood. In the original style of Boule work some considerable degree of use was also made of pearl and ivory.

Dye woods were (and are) used as far as they are available, and greens, blues, and some other tints are often stained in. M. Cremer, of Paris, used the staining process of M. Boucherie, said to impart a permanent colour to a great depth. Shading is produced by

darkening the wood at the desired spot by the application of heated sand. These designs are then carefully glued upon the level surface prepared to receive them in the same manner as ordinary veneers.

All lines necessary to the designs, as, for example, the veins of petals or leaves, are cut on the wood with a graver or other suitable incurving tool, and afterwards filled up with wood dust and fine glue, pressed well in.

Boule and his followers often produced increased effects by carefully disposing pieces of the same kind of wood so that the grain ran in different directions, the effect thus attained being particularly pleasing.

To the Art student, be he pictorial or otherwise, I would recommend an early study of the work of Boule, if it be only for the sake of acquiring a knowledge of the beauty of form as applied to furniture. W. N. B.

KEYSTONES.

THE Church of Holy Nativity, Knowle, has just been further embellished by the addition of a stained glass window.

MESSRS. PEARSON BROTHERS AND CAMPBELL, of 57A, Dale Street, Liverpool, inform us that henceforward their address will be 5, Castle Street, Liverpool.

THE Town Council of Louth has applied for the approval of the Local Government Board of the borrowing of £1300 for the erection of a technical school.

A RECUMBENT figure in marble of the late Bishop Harper has been recently placed in the cathedral at Christchurch, New Zealand. The figure has been sculptured by Mr. Williamson, of Esher.

THE London County Council is erecting in Rosebery Avenue, near to Clerkenwell Town Hall, a handsome suite of buildings for a gas meter testing station for the northern districts of London. The tender for the erection of the building was £4257.

A LARGE and enthusiastic meeting of the inhabitants of Workington has unanimously passed a resolution empowering the Corporation to contribute a sum not exceeding £150,000 towards the erection of a new deep water dock for Workington.

THE Cambridge Music Hall, Bishopsgate, which was burned down some time ago, has been rebuilt, and was reopened last week. The new building, which is in the Moorish style, has been furnished by Messrs. Maple and Co., and every up-to-date convenience and improvement has been adopted.

IT is stated that at a sale at Munich a Genevan thaler reached the extraordinary price of over £3000. It bears the date 1598, and there are only two others in existence. It is four times the usual thickness, and has the initials of Jean Gringelet, a celebrated medallist.

AT Eccleston Square Congregational Church, Belgrave Road, S.W., a memorial tablet to Dr. J. Hiles Hitchens, pastor for twenty-six years, has been unveiled. The tablet, which is a large piece of Gothic work, is in Caen stone, with marble panel and Devonshire marble columns, and has been executed by the Art Memorial Company.

THE West Yorkshire Provincial Grand Lodge of Freemasons are about to erect a new masonic hall in Leeds. Several plots of land have been inspected, and the committee have now chosen a central site in Great George Street and Rossington Street. An offer has been made for the land, but it has not yet been definitely accepted. After the completion of the negotiations, no time will be lost in the preparation of plans and in letting the various contracts.

A PLAN which has long been discussed is about to be realised at Budapest. The enormous four-storied house of Herr Anton Dreher—situated in the Hatvaner Utza, which leads to a railway station, and has just been widened 75ft.—is to be moved back into line with the new houses which have taken the place of the ugly old buildings that encumbered the street. Two Hungarian engineers have worked out the plans for moving the Dreher House with American screws.

Professional Items.

BEBINGTON.—The Victoria Hall recently erected has been opened. The building occupies an elevated site on the roadside entering the village, and, though carried out in a simple domestic style suitable to the surroundings, is enlivened with some marked features in the gables, and by the red tiling of the roofing. The lower portions of the outside walling is of rock-faced stone from the neighbouring quarries, the parts above the ground floor window sills being faced with pebble-dashing of a warm ochre tint. The principal gables are filled with an effective but inexpensive treatment of sgraffito work, carried out by Messrs. Goodall and Sons, of Liverpool. The design embraces the Royal Arms, and the rose, shamrock, and thistle, marking the building as a Jubilee memorial. The present accommodation provided consists of two classrooms for technical instruction, entrance hall, and the large hall, which latter affords accommodation for some 350 seats and stage. The walls internally are finished in red duresco with a frieze of buff, laid direct on the brick lining. The general contractor's work has been carried out by Messrs. Lee and Son from the designs of Mr. Charles Deacon, architect.

BRADFORD.—The buildings erected during the past twelve months have all been of a minor description, although there has been an increase in the number of them. The number of plans deposited for the erection of dwelling-houses was higher last year than in 1896, but those for warehouses and mills have slightly decreased. The total number of plans approved is 439, as against 399 for the previous twelve months.

BRISTOL.—A plan for new municipal buildings in Bristol has been submitted by Messrs. C. B. and S. J. Loxton, surveyors, and has, we understand, been laid before one of the Corporation committees. It is proposed to take in that portion of St. Augustine's Parade which lies between Denmark Street and Pipe Lane, running back to Orchard Street. The building would have a frontage to the New Centre of about 400ft., with an open space of about 300ft. from the end of Clare Street and Baldwin Street. The approximate cost of a building has been estimated at from £90,000 to £100,000. The purchase of the site, as estimated by the Land Steward in 1893, was about £150,000, together making the aggregate cost about £250,000.

CHELMSFORD.—The proposed alterations at the Great Eastern Railway Station include the superseding of the heavy projection on the up-side, intended for a shelter, by a light awning of modern construction. The booking-office will be improved, the adjacent parcels office enlarged, and alterations made in the lower portion of the premises, so as to throw more light into them. The platforms will not be lengthened, but they will have a uniform width of 14ft. 3in. A new staircase will be made for the down platform. Upon both platforms, up and down, there will be awnings of over 250ft. in length. Alterations will be made to the present buildings on the up platform, so as to provide accommodation for the station-master, ticket collectors, and porters; and a new block will be constructed between these buildings and the London end of the platform for the general waiting-rooms, &c. A new lift, worked by hydraulic or steam-power, will be provided at the Springfield end of the station, in place of the present one, which is the cause of a good deal of obstruction. The alterations are expected to be completed by next summer.

CROMER.—Those who were acquainted with the little, old-fashioned hostel named the Hotel de Paris, Cromer, will know it no more, as it has been replaced by a *fin de siècle* building of handsome proportions. The dining hall occupies entirely one end of the building, having six bay windows, all commanding good sea views.

The principal staircase starts out of the central hall and a part of the central hall is carried up two floors high, and a gallery formed round the opening, while light enters from the ceiling by coloured lead-glazed ceiling lights. On the upper floors are numerous suites of sitting and bedrooms connected by wide corridors, all of ample dimensions.

DUNDEE.—A window has been presented to St. Mary's Parish Church to commemorate the Diamond Jubilee of the Queen. It occupies the great east side of St. Mary's, is in keeping with the stately Architecture of the building, and in harmony with its character and purpose. The donors were fortunate in obtaining the co-operation of Sir Edward Burne-Jones and the late Mr. William Morris. The window has twelve divisions, and the subject which naturally suggested itself was that of the Twelve Apostles, with angelic figures in the traceried portions above. Eleven of the Apostles have been drawn by Sir Edward Burne-Jones, and the twelfth—St. Bartholomew—by Mr. William Morris. The glass of the window has been made at Messrs. Morris and Company's works at Merton Abbey, in Surrey.

ECCLESHALL.—An important and much-needed work—the restoration of the Eccleshall Parish Church tower—has been inaugurated. The architect, Mr. Basil Champneys, estimates the cost of the whole interior and exterior repair of the tower, including new parapet and pinnacles, new roof, floor, door, clock-faces, louvres, stonework, &c., at £856 10s. or thereabouts. Mr. Champneys proposes to remove only such stones as are radically unsound, so as to disturb as little as possible the ancient appearance of the tower. At a meeting of parishioners the following resolution was carried:—"That this meeting, being convinced that there is urgent need for the tower of the parish church to be thoroughly restored, hereby requests the churchwardens forthwith to follow up the steps that have been already taken for that purpose, and pledges itself to do its utmost in assisting them to raise the requisite funds."

EDINBURGH.—In our criticism of the designs submitted in connection with the Cardiff Town Hall and Law Courts Competition, a set of drawings under notice are attributed to Mr. Bran, of Croydon. The author of the drawings in question is Mr. William Bevan, of Edinburgh.

FERRABE.—The new Church of the Immaculate Conception at Ferrabene is now completed. Its imposing tower is also finished. The new church, which is decorated Gothic in style, consists of nave, with gallery at west end, chancel, north and south transepts, sacristies, and baptistry, and affords seating accommodation for about 700 persons. The interior of the church is very fine, the nave floors and also the floors of the chancel and transepts being laid with encaustic tiling of a beautiful pattern. The windows are filled with stained glass, rich in colouring and chaste in design. The roof is of open timber construction with panels and moulded ribs, finished with carved bosses at intersections, the effect being very pleasing. Externally the church presents a very fine effect, a striking feature being a well-proportioned tower and spire rising to a considerable height at the west end next entrance, and visible from all parts of the surrounding country.

GLASGOW.—The memorial stone of the new Chalmers Free Church has been laid. The new church fronts Pollokshaws Road, with class-rooms and hall in a separate building at the corner of Cavendish Street. There are side galleries over the aisles, also an end gallery, the seated accommodation being in all 840. In the front the central entrance is protected by a circular portico, the pillars of which are 22ft. in height. The nave is roofed with a level ceiling, divided into panels. The contracts for the church and hall amount to £6000. The architects are Messrs. H. and D. Barclay, and the contractors are:—Masons,

Webster, Walker, and Webster; wrights, Allan and Baxter; plumber, Colin Turner; slaters, A. and D. Mackay; plasterers, Alex. Calder and Son; gasfitter, John Hunter; painter, John L. Duncan; glaziers, The Blythswood Stained Glass Company. Mr. Charles Wilton is clerk of works.

A new theatre, to be called the Metropole, has been added to the list of Glasgow playhouses. Built upon the site of the old Scotia Music-hall, the transformation is complete. No doubt the walls of the old building remain, but the interior has been practically gutted and replanned. The handsome domed roof has been preserved by the architects, but about a dozen iron pillars which supported it have been removed, and strong trusses, stretching from wall to wall, substituted. The stage occupies the same position, but has been thrown forward into the auditorium some 12ft. A beautiful interior has been secured. It differs from all the other Glasgow theatres in this respect, that the audience in every part of the house is brought exceedingly near to the stage. To attain this end the great height of the building has been utilised by deeply sloping the galleries. The architects have planned a house on classical lines, which, while possessing every attribute of a charming interior, appears smaller than it really is by reason of its very compactness. The auditorium consists of a pit with front stalls, a dress circle with about 300 chairs, an amphitheatre and gallery seated together for about 1000 people, and four private boxes on the level of the circle and amphitheatre, two on either side of the stage. The general plastic decoration employed alike on the proscenium and balcony fronts is Grecian in design, and the scheme of colour a pleasing blend of cream, light pinks and blues, relieved with gold. Round the front of the dress circle balcony mythological gods and sea-horses are drawn in plastic relief, and on the balcony above dolphins and other scroll figures are similarly treated. The proscenium, following the same classical design, is tastefully decorated, having on either side a couple of white fluted Corinthian pillars with gold capitals and bold model figure work at the base. In height the proscenium is 36ft., the same as that of Drury Lane. Surmounting the proscenium is a large symbolical figure representing music and the drama, and on panels flanking it are scrolls bearing the names of "Shakespeare" and "Sullivan." The stage itself is about 42ft. deep by 80ft. wide, and has a gradient of 1 in 24. The pit gradient is 1 in 16. Mr. Wm. Hope and Mr. J. C. Maxwell, Newcastle-on-Tyne, were the architects of the building; Mr. S. F. Davidson, of the same town, was builder. Messrs. Claud Hamilton, Limited, Glasgow, supplied the electric light installation, and Messrs. A. R. Dean, Limited, Birmingham, carried out the plastic decorations and furnishings.

HALIFAX.—Building during 1897 has been fairly brisk. A large new workhouse hospital is in course of erection at Skircoat, and the first instalment of the scheme will, it is estimated, cost £100,000. There has been a fair amount of speculative building, but some difficulty has been experienced in obtaining slates for roofing buildings.

HUDDERSFIELD.—Not very many houses have been erected during 1897, there being a large number still to let. Prospects are tolerably good for the coming year. Amongst public works to be early undertaken will be the extension of Huddersfield Infirmary, and of the Corporation electric lighting works. Should the Midland Railway Bill pass, and the works be begun at once, the building trade will receive a great impetus.

INVERNESS.—For the past few years the building trade in Inverness has been attended with remarkable briskness. Many notable structures have been erected, and the old fabrics that remain have been so remodelled that they now contribute to the architectural beauty of the Highland capital. In the commencement and completion of important buildings the past year has been specially

noteworthy. The buildings of a public or semi-public character in course of construction last year have been both numerous and important. St. Stephen's Church has been erected in Barnhill district, at a cost of about £3400. The new Crown Free Church Hall, is estimated at £650. Considerable progress is being made with the remodelling and enlarging of the old Free East Church in Academy Street. The Tweedmouth Memorial Chapel at the Northern Infirmary is also nearing completion. Recently, the Highland Railway Company purchased the house adjoining the old Academy and fronting Queen's Gate, with the object of forming a new entrance to the proposed new through station, and along this roadway the trustees of Messrs. Strothers have erected a long range of warehouses. The new block, which is to cost £7000, will have a frontage of 70ft. to Academy Street, and a frontage of 50ft. to the railway thoroughfare. In Castle Street there have been many important improvements during the year, and the same remark applies to the Exchange, East Gate, Rose Street, and many other thoroughfares. Tenement building has also been very brisk, and plans have been passed for the erection of several large blocks of houses in various parts of the town. It is contemplated to erect new prison buildings at Inverness, the Castle Jail being too small to meet the requirements. Considerable alterations and additions are also about to be made at Culloiden House.

KNIGHTON.—The recent alterations and extensions to Knighton Parish Church make it one of the most noteworthy edifices in the county of Radnor. The nave of the church was restored about 20 years ago at a large outlay. Owing to various difficulties, however, the chancel remained untouched, and, though many efforts were put forth in succeeding years to place it in harmony with the other portions of the building, it was not until 1896 that active measures were taken to that end. The designs were furnished by the late Mr. Pearson, R.A., and the builders were Messrs. Cadwallader and Weale. The new chancel is 37ft. by 25ft., while the dimensions of the organ chamber are 14ft. by 12ft., and the total cost of the extensions is a little short of £3000. The floor of the chancel has been paved with encaustic tiles. The new part of the building is brightly illuminated at night by the incandescent light. The choir stalls are of carved oak, and have been furnished by Messrs. Jones and Willis, Birmingham, who have also supplied other fittings. A stone pulpit of ornate design has been substituted in place of the old one.

LEEDS.—A memorial of the late Vicar of St. Martin's, Potternewton, has been dedicated. The memorial takes the form of a new baptistery at the west end of the church, the appearance of which has thus been considerably improved. The extension really consists of a tower, about 50ft. high and 16ft. square inside. At the top is a belfry, and the building is strong enough to allow of the tower being carried higher at some future time and of a spire being added. The font, which previously stood in the north-west corner of the church, has been placed within the baptistery, and a tablet upon one of the walls bears a suitable inscription. The work, which has cost about £1000, has been carried out by Mr. Isaac Gould.

The work in connection with the construction of the Grand Arcade is now approaching completion. The south avenue is open, and it is expected that the other sections will be finished shortly. The Grand Arcade forms a handsome addition to the buildings in New Briggate and North Street. It is bounded on the west by the first named street, and on the east by North Street. Lower Merriam Street forms the boundary on the North, and on the south the arcade is separated from the Grand Theatre by a private cartway for goods. There are two main avenues and a transverse avenue entered from the centre of lower Merriam Street. In consequence of the shape of the ground the two parallel avenues vary somewhat in length. One is 286ft. and the other 263ft., and both are 18ft. wide. The

cross-arcade is 105ft. long by 15ft. wide. The façades to New Briggate and North Street are carried on wrought-iron boxed girders resting on polished red granite piers placed between the shop windows, those at the entrances to the avenues being circular. Over the shop windows are mullioned bay windows. The upper portion of each façade is divided into three imposing gables, which are broken up by moulded strings and cornices, and surmounted by bold, enriched pediments. There are two entrances from New Briggate and North Street under semi-circular arches, each being 16ft. span and 24ft. high. These arches, together with the arcades, are faced with faience highly enriched and of varied tints. The bay windows over the shops, an oriel at the north-west corner of the Briggate elevation, and the gables previously referred to, together with the general walling of the Briggate and North Street front are faced with red and buff terra-cotta. The arcades have a light and airy appearance, the front walls over the shops being set back 1ft. 9in. on either side, thus making the span of the glazed iron roof 21ft. 6in., which is 3ft. 6in. wider than the floor of the arcade. The roofs have semi-circular wrought-iron bindings of light and artistic design, 15ft. apart, supported on pilasters with enriched caps and moulded bases, all of faience. The floors of the arcades are laid with marble mosaics of light tints, with bold and simple border lines. The roofs over the shops are covered with the best light sea-green Westmorland slates. The entrances will be closed at night by wrought-iron gates of ornamental design, which can be lowered into the basement, or raised up into the arcades themselves to form grills therein. Altogether there are fifty-six shops. Messrs. Smith and Tweedale, South Parade, are the architects.

LUTON.—Mr. R. F. Turner, of Camden Town, has just purchased a site in a central position of Luton for the erection of a theatre, the cost of the building being estimated at £14,000. Plans for the theatre, which have been passed by the town council, show a large, stately building, about 60ft. high, with a frontage of 60ft., with seating accommodation for over 800 persons, arranged as pit, stalls, private boxes, dress circle, &c., compact and prettily arranged as any provincial theatre.

ROTHERHAM.—In recent years the exterior of Wath Parish Church has shown unmistakable signs of the ravages of time. To such an extent had the decay of some portions of its masonry become apparent, that it was considered necessary to repair the structure before any serious damage occurred. Workmen have been busy for the last three months taking out the decayed stones and replacing them with new, but no attempt has been made to depart from the original character of the work. Wherever a stone has been extracted, another, similar in shape, has been inserted, with its exposed surfaces blackened to prevent any appearance of incongruity, and dark-coloured cement has been employed throughout in the pointing. The spire, upwards of 100ft. high, required no new stones, incipient decay being unobserved. The freehold of the chancel is vested in Christ Church, Oxford, and this portion of the sacred edifice—though also needing repair—has not as yet received attention; but it is hoped it may do so ere long. The spaces between the stone ribs of the porch ceiling have been filled in with oak boards, and the roofs and rain-water pipes overhauled and made good. Mr. Fidler, of Eckington, was the general contractor, and the work has been carried out under the superintendence of Mr. Wilfred Campsall, architect, of Sheffield.

TAMERTON.—The railway station recently erected has been opened. The station, which is at Warleigh Wood, has two platforms, each 400ft. long, with a waiting-room on the up side, and a large building, containing all the offices and stationmaster's residence, on the other. The contractors were Messrs. A. R. Lethbridge and Son. The road leading to the village has been made at a cost of £1350.

Under Discussion.

THE WINTER SESSION.

PERTH ARCHITECTURAL ASSOCIATION.

The Perth Architectural Association met on Wednesday week, when Mr. John Anderson read a paper on "Dean of Guild Court Procedure." Mr. Young, the president, presided.

LONDONDERRY LUNATIC ASYLUM COMPETITION.

At the annual meeting of the Royal Institute of the Architects of Ireland, held recently, the report presented dealt largely with the controversy *re* the Londonderry Lunatic Asylum Competition. It states:—"A letter was addressed to the Board of Control, pointing out that the schedule of fees was much under the usual scale adopted by the Profession, and a copy of the recognised charges of architects, as adopted by the Royal Institute of British Architects and the Royal Institute of the Architects of Ireland, was forwarded to the Board of Control. The Board, in reply, informed the Council that it had been decided in the case of the Londonderry Asylum Competition to revert to the former scale already agreed to in the cases of the Portrane and Belfast Asylums. The Council, in conveying their thanks to the Board for their courteous communication, drew attention to the impracticability of the proposal of the Board of Control to withdraw the specialist's work from the architect's control. Your Council is of opinion that in order to carry a building to a successful conclusion it is absolutely necessary that at all stages of the work, from its original inception to its completion, the architect should exercise a general control over all the various contractors employed, and that he should be held responsible for bringing the entire undertaking to a successful issue. If the specialist's works were withdrawn from his control, divided responsibility would result, and in many cases dissatisfaction and possibly litigation would ensue. In connection with the employment by the Board of Control of Architect for Lunatic Asylums, the Council desires to place on record its emphatic condemnation of the practice of appointing as a nominal architect any person with whom it is proved necessary to associate a qualified architect, in order to ensure the preparation of proper plans and the necessary skilled supervision of the work, as, when such appointments are made, professional fees are paid to persons by whom no equivalent service is rendered to the public. It is the unanimous opinion of the Profession that when the design of an invited competitor is placed first by the assessor, the author should be rewarded by being entrusted with the whole of the work for which he was invited to compete and all emolument attaching to it. The Council has had under consideration the action of the Blackrock Commissioners in passing a resolution stipulating that the architect to be employed for an extension of the Town Hall should pay the clerk of works out of his commission, in contravention to the recognised rules of the Profession. The Council, in consequence of this resolution, decided to re-issue the rules as regards the charges of architects, which were adopted by the Royal Institute of British Architects in 1872, and by the Royal Institute of Architects of Ireland in 1867, and to present a framed copy of these rules to every member of this Institute."—Subsequently the meeting passed the following resolution:—"That we, the members of the Royal Institute of Architects of Ireland, desire to convey to Mr. W. H. Byrne our appreciation of his honourable and disinterested action in the matter of the Londonderry Lunatic Asylum competition. We welcome this additional evidence of the willingness of architects taking part in competitions to abide loyally by the award of a qualified professional assessor, and we deprecate any attempt to set aside or interfere with such an award."—The President (Mr. Thomas Drew) was re-elected.

Correspondence.

THE INSTITUTE EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I was interested to read Mr. Ernest Danford's remarks upon my leader in your issue of the 8th inst. entitled "Some Anticipated Regrets." I would like to point out, however, that the article was in criticism of "those various schools, studios, and classes, which of late years have so multiplied for the instruction . . . of architects," and was not directed against the Institute examinations, which I only mentioned as the probable explanation of this educational activity. I may add that my views on the subject of the Institute examinations accord, in the main, with those expressed by Mr. Danford, but they have, as he very truly remarks in his letter, been already expressed "over and over again," and since they are familiar to everyone I thought I might venture to turn for once to another phase of the subject.—I am, sir, yours faithfully, B. C.

SKIPTON COTTAGE HOSPITAL COMPETITION.

To "VERBATIM ET LITERATIM."

DEAR SIR,—I noticed your letter in the BUILDERS' JOURNAL of December 29th. As a competitor in this competition, I should be obliged if you will inform me if you were allowed to inspect the drawings in this competition, as I notice you refer to an elaborately coloured perspective view submitted by the successful competitor. The reason I ask is that my drawings were simply returned to me without any communication as to whether the competition was settled, and, if so, who was the successful competitor? I wrote to the secretary asking to be allowed to inspect the drawings after the decision of the assessor, but received no communication from him whatever. I think this sort of treatment most discourteous, and from your letter, the competition has been conducted in a most unfair manner.—Yours truly, T. EDWARD MARSHALL.
December 30th, 1897.

GUILTY OR NOT GUILTY?

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—It seems to me that the correspondents writing under the above heading are, as usual, all for their own side of the question. The workman says his master cheats and the master says his workman cheats! We hear much nowadays about what great interest the Mediaeval workman—builder and architect—always took in those noble buildings erected by them; and it makes us wonder why the men of to-day are so altered. I think the reason is the extreme hurry that men in this age are in to get the work done. The first question that one hears after "What will it cost?" is "When will it be done?" and in this hurry many things are sacrificed. Again, the worker in the olden times carried his portion of work through from the beginning to the end; nowadays a workman may start a piece of work and twenty workmen may finish it. And, as "Stonemason" observes, the builders and architects of to-day have their shady transactions; if it were possible, I could name some large firms in London doing very important work in which inequitable practices have been resorted to, and perhaps "Se Defendendo" would acknowledge that things had been painted no blacker than they really are. Can the men be expected to take an interest in work when the master looks at the work and thinks only how much money he can make out of it. I have generally found that men when treated properly and allowed to take interest in their work produce very satisfactory results. I think that much may yet be done by the masters trying to show the men that they want them to be more than mere machines. When the architect has learned to avoid designing to "catch the eye," and the builder has learned to build honestly, the workmen may learn to work thoroughly and faithfully, but not before.—Yours truly,

WITHOUT PREJUDICE.

A PLEA FOR REGISTRATION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I have read with much pleasure in your issue of a fortnight ago Mr. Danford's valuable letter on the Institute Examinations. Some expressions contained therein are, to my mind, well worthy the universal attention of architects.

We must all admit that the examinations of the Royal Institute of British Architects are now beginning to be regarded as perhaps the best test of an architect's abilities under the existing order of things. But, notwithstanding this faint glimmer of acknowledgment, and the misty form of a higher appreciation of Art to which the British public are some day to be introduced, the architectural profession is regarded (if not actually with contempt) with absolute indifference.

Will any one of its leading members stand up and say conscientiously that the Profession of which he is a member holds the same status in the estimation of the public which the profession of law and medicine enjoys? I venture to answer for him in the negative. Why should such a state of things exist? Why should the Profession of Architecture be left open to all comers?

To my mind Mr. Danford hit the nail on the head when he suggests registration. With registration an accomplished fact, some, at least, of its attendant benefits would be: 1. Those who at present receive their only training (careful and valuable though it may be) at Polytechnics and technical classes would be precluded from establishing themselves as architects. 2. That all registered practitioners would be fully qualified in all technical requirements and at least well grounded in the various forms of expression which Architecture has adopted under the lead of great architects of modern and mediæval times. 3. That the employment of unqualified architects or the payment of less than the recognised fee would be as illegal as the employment of an unqualified doctor or an amateur solicitor.

It may be said, and, indeed, often is said, that registration would be derogatory to the dignity of the Profession, and possibly a hindrance to the expression of the Art. Such expressions as these are, however, unwarranted by precedence; and as to the oft-repeated remark that the same registration system as proposed to be applied to the practice of Architecture should also apply to the arts of sculpture, painting, and music, surely the circumstances under which each are employed should render apparent the absurdity of such a proposal.

The only method to test an architect's fitness for the duties to be discharged by him is examination in the various subjects connected with the Profession of Architecture.

This is what the Institute examinations aim at. Nothing more or less. But that more is required can be easily seen by the impartial observer.

People must live in houses designed for them by their architects, no matter how faulty their construction from a sanitary or hygienic point of view, although buildings may, like Dead Sea fruit, look fair to the eye. But no one is bound to employ sculpture or painting.

Again, assuming that general education has advanced to such a degree that the householder will require painting and sculpture to decorate his house, and also be able to choose and distinguish his Art, it is not unnatural to suppose that he will at the same time be also able to demand and appreciate Architecture as an Art.

For the present let us agitate for registration, or some kindred scheme of protection and State recognition, which would exclude the incompetent and untrained from the ranks of the Profession, and protect the unfortunate architects who live for and by their Art. The few great men of the Profession are, no doubt, out of harm's way, and their practice is beyond the reach of the unskilled and incompetent; but their less fortunate brethren scattered throughout the provinces feel keenly the inroads of the Cheap Jack.—Yours faithfully,

A. K. S.

Enquiry Department.

We have pleasure in announcing that the services of specialists in every branch of the building industry, or representative of every phase of architectural thought, have been secured in connection with our "Enquiry Department." We shall at all times be pleased, therefore, to receive queries from correspondents, and lay them before the specialists concerned, who, in their turn, will be pleased to give the fullest and most accurate information.

CONSTRUCTION OF WOODEN BUILDINGS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I shall be glad to hear of any work which treats of the construction of temporary wooden buildings, suitable for seating large assemblies.

CONFERENCE.

So far as we are aware no book has been published dealing with the construction of temporary wooden buildings. Nor can we meet with any London publishing firm who are able to recommend a work which is likely to be of service to you.

STEAMING OF AIR-TIGHT CASES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you inform me if there is any remedy for the steaming of an air-tight case for a jeweller's window? The one in question is about 10ft. 6in. by 3ft. by 6ft., and the windows become quite opaque with the steam that is formed on them. When the doors of the case are opened, the steaming subsides a little, the top part of the window becoming clear, whilst the bottom remains unaltered.—Yours truly, C. W. S. B.

If you wish to preserve the case air-tight, your only remedy is to paint the glass with collodion or dissolved gelatine. This would effectually obviate steaming on the surface of the glass, though it would not get rid of the moisture consequent on the dissolution of the enclosed air. A more effectual remedy would be to have a couple of holes on the top and bottom of the case, thus ensuring thorough ventilation, though with this remedy the case, of course, no longer remains air-tight.

ART METAL EXHIBITION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I shall be much obliged if you would kindly, through your enquiry department, inform me of the name of the secretary, and any other information concerning the forthcoming Art Metal Work Exhibition at the Royal Aquarium, London, in June next, as mentioned in your columns.—Yours faithfully, H. R. N.

All communications with regard to the Art Metal Exhibition should be addressed to Mr. Edgar S. Shrubsole, Royal Aquarium, Westminster, S.W., who is the organiser of the Exhibition, and who will supply full particulars as to the conditions, with illustrations of designs, &c.

VALUING OF HOUSE PROPERTY.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you recommend me a work treating upon the valuing of small house property, &c., and the law upon the subject.—Yours faithfully, BALLOT.

The following books, all published by Messrs. Crosby, Lockwood and Son, will give you the required information: "Handbook of House Property," by E. L. Tarbuck, 5s.; "The Appraiser, Auctioneer, Broker, House and Estate Agent, and Valuer's Pocket Assistant," by John Wheeler and C. Norris, 5s.; "Tables for the Purchasing of Estates, Freehold, Copyhold, or Leasehold"; "Building Estates," by F. Maitland, 2s.

Trade and Craft.

THE THORNTON-PICKARD MANUFACTURING COMPANY LIMITED.

We have received from the Thornton-Pickard Manufacturing Company Limited, Altrincham, an advance copy of their new 1898 illustrated catalogue, which is got up in the excellently artistic style always employed by this well-known firm. In the introduction to the catalogue, we are told that "the sales for 1897 again show an enormous increase upon previous records;" and if the general appearance of the new catalogue is any criterion, we should say that the record will again be beaten in 1898. As is well-known, the products of the Thornton-Pickard Manufacturing Company are reliable, and in every way satisfactory; and it is a pleasure to look through this new catalogue (the best yet issued by the Company) and note the particulars respecting new apparatus for 1898. They include a new 5 by 4 size of the Amber Camera; the new patent film carrier already noticed in these columns; and a new aluminium shutter specially designed to meet the requirements of those who cannot afford to purchase the Standard Pattern Shutter. Full particulars are given in the catalogue of the competition for £200 in prizes. A catalogue will be sent free by post on application to the Company at Altrincham.

A DEFECTIVE CHIMNEY.

An interesting judgment was given in the Queen's Bench Division in the case of *Clarke v. Sadler*. It was an action in which the plaintiff, Miss Clarke, sought to recover compensation from the defendant, her landlord, for damage done to her furniture by a fall of soot down her drawing-room chimney. The plaintiff rented a flat in May, 1896, from the defendant in Idlesleigh Mansions, Victoria Street. She found occasion to complain to her landlord that her drawing-room chimney smoked, and there were constant falls of soot from it. In consequence of her complaints her landlord, in January last, employed a firm of contractors, Messrs. Brady and Co., to fix one of their cowl on the top of the chimney in question, in order to remedy the nuisance complained of. Messrs. Brady and Co.'s men put up the cowl, and while doing so there was a great fall of soot, which did serious damage to the plaintiff's carpet and furniture. For the defence it was contended that Miss Clarke had no right of action against the defendant. He had employed a competent independent contractor to put up the cowl, and therefore was not personally liable. If Miss Clarke had any right of action it was against Messrs. Brady and Co. The case was tried before the learned Judge and a special jury on December 1st, and in answer to questions put to them, the jury found that the defendant did contract to put up the cowl, but it was not agreed that the work was to be done reasonably and carefully; that Messrs. Brady did not undertake to do anything except to fix the cowl; that the operation of fixing the cowl was one which was likely to cause mischief to the plaintiff unless precautions were taken; that the work was negligently done. His Lordship then reserved the case for further consideration. After hearing the arguments of counsel, the Lord Chief Justice said it was clear that if the defendant undertook to do this thing for the plaintiff, the reasonable effect of that undertaking was that the obligation must be taken to be that reasonable care should be observed to prevent damage being caused to the plaintiff inside the house, as well as externally. Messrs. Brady were only deputed to do part of the work, the external part, and it was for the defendant to take precautions that no internal damage was done. Assuming that the plaintiff voluntarily undertook to do this work, and did not take reasonable precautions, he would be equally responsible. Under the circumstances, whether it was a contractual obligation or whether the work was done voluntarily, the defendant was liable.—Judgment was given for the plaintiff for £41 and costs.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

AMBLESIDE.—Accepted for erecting new Wesleyan chapel. Mr. T. W. Cubbon, architect, Bank Buildings, 54, Hamilton-street, Birkenhead.—
T. Newton £2188

BARKING (Essex).—For the erection of an electric light station, East-street, for the Urban District Council. Mr. C. J. Dawson, architect, Public Offices, Barking.—
C. J. Coxhead £2,257
Geo. Sharpe, Stratford, Thunders and Edg. 2,787

* Accepted by Committee, subject to approval of Council.

BRIDLINGTON QUAY.—For the erection of four houses and premises, East Side, Flamborough-road, for Mr. W. Baldwin. Mr. J. Earnshaw, architect, Wellington-road, Bridlington Quay.—
W. Barnes £3,609
R. Bailey, Bridlington
W. Moody 2,992
Quay* £2,910

BROMLEY (Kent).—For the erection of four pairs of cottages at Jaffray-road, for the Bromley Co-operative Society, Limited. Mr. John T. Grubb, architect, Bromley. Quantities supplied.—

	Fences.	Total.
T. D. Grady	£2,613	£21 0
Podger and Son	2,134	71 15
Chapman	2,134	2,286 15
Hutchings	2,100	2,261 8
A. Poingdestre*	2,000	2,163 0
	88 16	2,068 16

* Accepted.

BROMLEY (Kent).—For the erection of four pairs of cottages, for the Bromley Co-operative Society, Limited. Mr. J. T. Grubb, architect, Bromley, Kent. Quantities by architect.—

T. D. Grady	£2,694 0 0	J. Hutchings	£2,168 0 0
Podger and Son	2,286 15 0	A. Poingdestre,	
H. Chapman	2,261 8 0	Bromley, Kent*	2,068 16 1

* Accepted.

DOUGLAS.—Provisionally accepted for erecting a Pupil Teachers' Centre and Physics Laboratory, for Douglas School Board. Mr. T. W. Cubbon, architect, Birkenhead.—
R. F. Douglas £1,492

[Architect's estimate, £1,450.]

ENNISKILLEN (Ireland).—For the erection of dispensary house, Derrygonally, for the Union Guardians. Mr. Thomas Elliott, architect, Dorling-street, Enniskillen.—
D. Funston £437 0
T. Elliott, Cashel,
John Donnelly 879 18 0

* Accepted.

FORRES (N.B.).—For the erection of shops and dwelling-houses, St. Catherine's-road and Boston-place, for Mr. William Fletcher. Mr. John Forrest, architect, 129, High-street, Forres.—

Masonry.—David Ross, Talbooth-street, Forres.
Carpentry.—Geo. Forrest, Mossitt-place, Forres.
Slatting.—Alex. Forbes, Tytler-street, Forres.
Plastering.—Angus and Ross, South-road, Forres.
Plumbing.—R. Forsyth, Talbooth-street, Forres.
Painting.—Arch. Macdonald, High-street, Forres.
Ironmongery.—W. Smith and Son, High-street, Forres.

LONDON.—Accepted for the erection of six houses, South-street, Camberwell, for Mr. A. V. Zwargberg. Mr. T. Wilson, architect, 34, New Bridge-street, E.C.—
Miller, Walthamstow £2,175

LONDON.—For the erection of a warehouse at Blackfriars-road, for Messrs. James Clark and Son. Mr. John J. Downes, architect, 199, Lewisham High-road.—
Moyle £1,214
John Appleby, Corn-wall-road, S.E.* £1,035

* Accepted.

LONDON.—For work in completing and decorating houses, Sisters Estate, Clapham Common, for Mr. H. Shepherd Cross, M.P. Mr. William Hunt, architect and surveyor, Donington House, Norfolk-street, Strand.—
Ham and Son £4,004 0
Wm. Ellis and Son £2,520 0

J. S. Minter £3,265 0
G. Godson and Sons £3,079 0
Turtle and Appleton 3,850 0
Peacock Bros. 2,980 10
J. H. Jenkins and Co. 3,335 0
H. and E. Lea 2,840 0
Wm. Antill and Co. 3,240 0
J. S. Minter 2,750 0
W. H. Lasselles and Co. 3,156 0

LONDON.—For new buildings, Upton-lane, Forest Gate, E., for the Forest Gate Laundry Company, Ltd. Messrs. Reeves and Syvche, architects, 8, Gray's Inn-square, W.C. Quantities by Mr. W. Courtney Fagg, 5, Union-court, Old Broad-street, E.C.—

	Extra for patent glazing.
Shillitoe and Sons	£2,850
Gregar and Son	2,580
Hearle and Farrow	2,498
Scrivener and Son	2,492
Welsh and Son	2,475
G. J. Hosking	2,457
Heyworth	2,434
Turtle and Appleton	2,430
Harris and Wardrop	2,335

* Including extra.

LONDON.—For erecting three shops, Queen's-road, Bayswater, W. Mr. Chas. G. Maylard, architect, 59, Cleveland-square, Hyde Park, W.—
Stephens, Bastow, and Co., Ltd. £7,798
Patman and Fotheringham £6,928

LONDON.—For alterations and additions to the "Eton Arms," Lower Park-road, Peckham, for the Winchester Brewery Company. Mr. T. W. Moss, architect.—
Ham and Son £577
W. Irwin £435

LONDON.—For the erection of additional paper, roller, and block stores to paper-staining works, Chiswick, W. Mr. Edmund M. Bowyer, architect and surveyor, Bloomsbury-mansion, Hart-street, W.C.—Quantities by Mr. John Windsor.—

	Clearing Site.	Iron Construction.	Fireproof Floor.	General Building Work.
Wheatley, Chiswick	£174 12 8			
Lindsay, Neal, and Co.	£937 15 2			
Stuart's Granolithic Stone Co.	£360 18 9			
B. E. Nightingale	£4,885	Prestige and Co.	£4,233	
H. Roffey	4,566	T. Nye	4,105	
Adamson and Sons	4,870	E. Lawrence and Sons	4,181	

MORECOMBE.—For the erection of house and three shops, Margaret-street, Bare, for Mr. Corless J. Miller. Mr. Jas. Marshall, architect, Back-crescent, Morecombe.—
Joinery.—Acton and Sons, Lancaster £343 0 0
Masonry.—Wagh and Ripley, Ilkley 713 0 0
Slatting and Plastering.—W. J. Cross, Morecombe £1,346 13 10
Rumbling and Glazing.—R. B. Abbott, Morecombe 145 0 0

MORTLAKE.—For forming new roads, Palewell Park Estate, Mortlake, for Mr. H. Shepherd Cross, M.P. Mr. William Hunt, architect and surveyor, Donington House, Norfolk-street, Strand.—
C. W. Killingback & Co. £2,257
W. Nichols £1,700
Bentham and Co. 2,024
H. Swaker 1,780
J. Jackson 1,850
H. Woodham 1,720

MYNYDDISLWYN.—For additions to school, Pontillfrith, for the School Board. Mr. Geo. Rosser, architect, Abercarn. Quantities by Mr. R. L. Roberts, Newbridge Mon.—
W. H. Ingleson £298 0 0
Rowland & Lloyd £725 0
Mainwaring and Davies 900 15 0
Ellis Williams 695 0
Williams & Thomas 998 0 0
Jno Pritchard 670 0
Edwards and Lawrence 842 6 6
C. F. Morgan, Newbridge* 645 10 0

* Accepted.

NEYLAND (S. Wales).—For the erection of Baptist chapel, for the Trustees. Mr. S. Wilson Edwards, architect, Beach Mount Villa, Mumbles.—
David Williams £1,967 0
John Morris £1,256 10
Lwl Davies 1,380 0
J. H. Thomas 1,251 0

TUNBRIDGE WELLS.—Proposed house, Boyne, Park, for Mr. A. W. Richardson. H. C. Lander, architect, Effingham House, Arundel Street, Strand, W.C. Quantities by Mr. J. T. Carey, 22, Surrey-street, Strand.—
W. E. Judd, Tunbridge Wells £1,999 0 0
C. J. Gallard, 1,744 0
Henry Young, East Grinstead 1,672 10 0
Strange and Sons, Tunbridge Wells 1,507 0 0

WEST HAMPTSTEAD, N.W.—For the erection of a block of residential flats on the site of Sandwell House, West End Lane, West Hampstead. Quantities by Mr. Geo. Stephenson, Messrs. Falgrave and Co., architects, Westminster. Holloway Bros. £14,335 0
Chessum and Sons £13,363
Patman and Fotheringham 14,100
Perry and Co. 12,900
Verbury and Sons* 11,940
Allen and Sons 13,975

* Accepted subject to modification.

COMPETITION.

THE URBAN DISTRICT COUNCIL OF EASTLEIGH.

TO ARCHITECTS.
The above Council invite APPLICATIONS from Architects for COMPETITIVE PLANS for the erection of PUBLIC OFFICES, &c., on their Recreation Ground in the Urban District of Eastleigh.

The Council offer two premiums of Fifty and Twenty Guineas respectively for the two selected designs (in order of merit), which is to include a copy of the plans for the Local Government Board.

The selected plans (which must be approved by the Local Government Board) to become the property of the Council, who do not bind themselves to employ the Architect whose plans may be finally selected, but, if he is so employed, the premium will be included in his commission and remuneration. In the event of a selected design not being approved by the Local Government Board no premium will be paid.

Further particulars and conditions can be obtained on application to me, at 19, St. Peter's-street, Winchester.

Plans (under motto, in sealed covers) must be sent to me at the Offices of the Council, Market-street, Eastleigh, not later than MONDAY, FEBRUARY 7th, 1898.

By order,
HENRY WHITE,
Clerk to the Council.

Offices of the Council, Market-street, Eastleigh, Hants.,
December, 1897.

R. I. B. A. EXAMS. PREPARATION.

personally or by correspondence, in three, six, nine, and twelve months' courses. Any subject taken separately. Special three months' course for any of the Exams. at reduced rate.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchar House, 70, Gower-street, W.C. (close to British Museum).

R. I. B. A. SOCIETY OF ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS.

Preparations by correspondence or in residence. Fourteen first places.—G. A. T. MIDDLETON, 19, Craven-street, Strand, W.C.

"EMPRESS" SMOKE CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney pot.

Full Particulars of Sizes, Prices, &c., on application to the Makers—

ESTABLISHED 60 YEARS.

Surveying and Sanitary SUPPLEMENT.

JANUARY 5TH, 1898.

THE COLLIMATION PLANE LEVEL BOOK.

BY G. A. T. MIDDLETON, A.R.I.B.A.

ALMOST all English surveyors are accustomed to use a level-book having columns for rise and fall; but of late years it has become customary amongst many to substitute a single column in which the collimation level is entered—that is, the

Accompanying, is reproduced a field book with one column for collimation level in the place of the two for rise and fall; and it will be seen that many less calculations are needed. On taking a back-sight, the collimation level is found by adding the reading to the height above datum; and as this collimation level is constant, so long as the level remains in the same position; all other heights above datum are entered by the simple process of deducting the reading at each spot from this collimation level.

Thus, the bench mark at the commencement

Then followed a series of intermediate sights, and the height above datum on each spot where these were taken was found by one single calculation, by subtracting the readings from this collimation height. Thus, at the start of the section line at station 4, the height above datum was 21.49ft. A reference to the plotted work will show how this was shown, though it is sufficiently obvious to anyone acquainted with levelling.

The checks upon the working are the same as usual. The back-sights and fore-sights are each totalled, and the difference between the

height of the axis of the instrument above datum. Why it is so slow in coming into universal use it is difficult to understand, for its advantages are considerable and obvious. When the rise and fall columns are used it is necessary to find the difference between each reading of a series and its predecessor, entering this difference as a rise or fall, as the case may be, and afterwards adding this to, or subtracting it from, the previous height above datum, in order to find the new height above datum. Thus two calculations are necessary.

of the line illustrated was found to be 16.53ft. above datum, the back-sight 3.93ft., and consequently the collimation level (which is equal to the sum of these) was 20.46ft. The next reading happened to be a foresight of 3.35ft., which, subtracted from the collimation level of 20.46ft., gave a height above datum of 17.11ft. The level was then moved, and a back-sight taken on to the spot which is now known to be 17.11 above datum. This back-sight read 7.11ft., and the new collimation level became 24.22ft.

totals should equal the difference between the first and last height above datum, if the arithmetic is correct. In order to check the accuracy of the field-work, however, the last reading of the series was taken on the same bench mark as that on which the series was started, with the usual result of there being a small but inappreciable error.

A series of cross levels was taken over a mound which occurred on the left hand side of the section line, at a distance of 450 links from the start, and the proper way of plotting this

THE COLLIMATION PLANE LEVEL BOOK.

is shown, together with the correct entries in field book. It very frequently happens that similar cross levels have to be taken, sometimes at quite short intervals, and while most surveyors plot them in the way shown, to right and left of the main section, treating that section very much as if it were the chain-line in a surveying field book, yet there are others who prefer to plot each separately, referring to them as cross levels at A, cross levels at B, etc., and putting similar reference letters on the main section. This is possibly the better plan when they occur frequently or where the height above datum shows considerable variation.

The Commission of Sewers, as a body, ceases to exist on January 10th, when it will be absorbed by the Corporation. The Special Committee which has considered the question recommend the creation of a Public Health Department in the place of the Commission, and the appointment for the purposes of the work of four committees possessing the same standing as the ordinary committees of the Court of Common Council, and constituted as all other ward committees are.

SIDMOUTH's new system of sewerage, constructed by the District Council in accordance with plans of Mr. James Mansergh, C.E., and Mr. G. R. Strachan, C.E., at a cost of £10,000, is now completed. In the carrying out of the work the most modern apparatus has been adopted, and storage arrangements provided in order that the sewage, by means of an outfall at "the Ham," may be discharged into the sea at a sufficient distance and only at hours when the current will carry the sewage away from the town. The work consists of a reconstruction of several of the old sewers, the provision of an impounding tank, and the moving of the outfall to a considerable distance eastward of the river mouth. New sewers have been laid down along the Esplanade, throughout Western Town and Eastern Town, Old Fore Street, Fore Street, New Street, Market Street, York Street, Ham Lane, Church Street, Cobourg Road, Mill Street, Mill Lane, Salcombe Road, through the meadows as far as the hamlet of Sid, Broadway Lane, and down the Bickwell Valley. The discharge is received into a covered concrete and white brick tank, 80ft. by 40ft., constructed in a field adjacent to the gasworks, and provided with a panstock which allows of the contents flowing to the outfall only at suitable states of the tide, thus preventing the possibility of anything being washed back on the beach. During the process of the work all defects in old drains have been repaired. The contractor for the work was Mr. C. Lang.

DILAPIDATIONS.*

BY PROF. HENRY BUSHELL, F.S.I.

AT the outset I think it important to draw attention to a "nicety" of distinction between what are actually dilapidations and the term dilapidated as applied to property used in a general sense by laymen and others. Some of the younger and less experienced members of the Profession often, I regret to say, make egregious mistakes in this direction, and consider anything a dilapidation which indicates want of repair, or even decay. Reluctant as I am to confess it, I have met some so-called surveyors scheduling dilapidations in such an exaggerated style as to suggest a total ignorance of the covenants of the lease, and evidently with little, if any, knowledge of the demised premises, or of the most vital principles of the law of dilapidations. I need not, however, point out to you the utter extravagance of scheduling as dilapidations every defect that could possibly be discovered under repairing covenants of a moderate degree. Worse than all, what is to be said of some persons who do not scruple to draw upon their imagination to such an extent (resorting to a text book for stereotyped expressions or schedules) as to give a capable person the impression that a good deal of the schedule savours strongly of the office lamp rather than of a careful inspection of the premises and a knowledge of the covenants of the lease? If such a *modus operandi* be consistent, then the most successful dilapidation surveyor (for the lessor at least) is the one who can find the greatest number of faults in a fabric. Such methods cannot, of course, be too strongly deprecated, and would, I am confident, never be sanctioned by the Council of the Auctioneers' Institute. To schedule dilapidations efficiently, the qualified surveyor would most naturally, as a first essential, study carefully the terms of the lease, well knowing that the drafting and wording of such must of necessity largely determine what are dilapidations (as well as to some extent their magnitude), the composition of the schedule, and, lastly, the valuation for claim. I know of no other branch of the surveyor's profession more onerous, or one wherein such ample opportunities are afforded for the active, skilful employment of that mature experience and sound judgment which some of the older members of the Profession fortunately possess; yet, when judges of high degree differ, in many notable cases, so

* A paper entitled "The Practical Application of the Principles and Law of Dilapidations," read before the Auctioneers' Institute,

strikingly in regard to the interpretation of covenants respecting dilapidations, surely one may with reason ask, "Who amongst us surveyors may be considered to have a perfect knowledge of this exact science?" And why is it that there are, comparatively speaking, so few dilapidation surveyors of special and acknowledged ability? Much as it is to be regretted, the ambiguity and uncertain nature of dilapidations, and the conflicting dicta of judges in cases of some importance which are on record, offer "charlatans" and other unqualified persons the opportunity to prey upon the public. I question the judgment of the beginner who holds aloof from, and assumes indifference to, the advantages and claims of any recognised professional institute or body which has for its chief object the raising of the status and the promotion of the best interests of its members. Having regard to the limited space at disposal for the consideration of a complex subject of the magnitude of dilapidations (necessarily involving so much of an obscure and controversial nature), I hope as far as possible to treat the subject in a natural order, and to effect an impartial consideration. I shall also endeavour to preserve an independent view of the different parties and interests. In the absence of specific data, it will be reasonable to assume that a lease of certain premises for twenty-one years' duration is about to be created, determinable by either party at the end of seven or fourteen years. At the earliest stage of the negotiations it would invariably be of immense advantage if a survey of the premises be made, and the condition be noted and endorsed on the lease. It is not the custom in this country, but would, I venture to think, be a desirable reform in the interests of all parties to a lease. I grant, however, that in certain cases it would be quite unnecessary, but, on the other hand, particularly in

CASES OF OLD PREMISES, or premises much above or below their "proper degree of repair," the precaution would be an admitted "indicator" of the condition of the demise at the commencement of the term, which would otherwise, at the end of a number of years, inevitably be a matter of doubt or speculation, probably resulting in litigation. The age of the premises at commencement of a lease is also of great importance. I do not think the age alone of a building necessarily affords sufficient proof as to what reparations are claimable, or of their degree of quality. It will usually be sufficient if the surveyor go upon broad and intelligent principles in determining to what extent the age and character of the demised premises will influence the extent of the dilapidations as well as their degree of quality, it being generally laid down by legal authorities that due and proper allowance must be made in respect of old structures, for the lessor is not to have, at the end of his term, a new structure, replete with modern fittings and improved accommodation in place of his old building. There are so many ulterior matters which affect almost every step that is taken in dilapidation cases, that rigid universal rules cannot be laid down or adhered to. The lease invariably contains covenants of a more or less stereotyped form, and although no particular form is necessary, the language used should clearly and unmistakably reveal the intentions of the parties. It may be taken for granted that in the case of leases for a number of years, the responsibilities are to be undertaken by the lessee, and this liability ranges downward from the case of a tenancy under which the lessee is liable in respect of all repairing and upholding covenants, to the simple case of a yearly tenant who is practically responsible only for voluntary waste or injury. Adverting briefly to the different modes of contract to repair, I cannot do better than quote that acknowledged authority, Woodfall. He says: "Leases of houses, &c., usually contain a covenant by the lessee to repair and keep in repair the demised premises during the term; also another distinct covenant to repair specific defects within a certain number of months (usually three) after written notice thereof; also to paint the outside wood and ironwork in a certain manner at stated times,

and a covenant to leave the premises in proper repair at the end or other sooner determination of the term, besides other covenants as agreed, after which usually follows a proviso for re-entry on breach on any of the covenants." The 14th section of the Conveyancing and Law of Property Act, 1881, affords the lessee relief against forfeiture. Under this Act a right of re-entry or forfeiture, arising from breach of a condition or covenant in a lease, shall not be enforceable by action or otherwise, unless and until the lessor serves on the lessee a notice which specifies the particular breach complained of, and, if the breach is capable of remedy, requiring the lessee to remedy the breach, and, in any case, requiring the lessee to make compensation in money for the breach, and if the lessee fails within a reasonable time thereafter to remedy the breach, if it is capable of remedy, to make reasonable compensation in money to the satisfaction of the breach. The Court may at any time during an action to enforce a right of re-entry or forfeiture, grant a lessee relief upon such terms as it thinks fit. For the purposes of this section lease includes an underlease. The section does not apply to covenants against assigning or under-letting, or to a condition for forfeiture in case of lessee's bankruptcy. Neither does it affect the law relating to forfeiture in case of nonpayment of rent. A person who proposes to take an unfurnished house on a lease of more or less severe form, would be prudent to engage a competent surveyor to inspect and report upon the condition of the premises, and the practical effect of the covenants, and more particularly as the worst defects in a structure are often not discoverable except under the most searching examination. It may be taken for granted that to be able to discern the effect of a series of covenants in a lease, in connection with premises of more or less indifferent build, a surveyor must possess special qualifications and training. The surveyor, if reporting for either party on covenants to a proposed lease from the practical as distinguished from their purely legal effect, will do well to examine the premises, and then carefully consider every covenant or undertaking (expressed or implied), especially those which set forth the maintenance of the premises, insurance, the periodical surveys for repairs, the degree of repair, the surrendering covenant, and the specific undertakings to paint or decorate internally and externally at fixed intervals of time. In short, the surveyor must be able, on the one hand, to protect the lessor's interest (usually effectually secured by reducing his liabilities to a vanishing point), or, on the other hand, to modify for the lessee terms which may appear to be unduly onerous and exacting. The importance in this direction is fully appreciated by Woodfall, who states, under the section referring to "Implied Contract to Repair by Landlord": "Although in letting a furnished house the lessor impliedly promises that it is reasonably fit for occupation, in the absence of any agreement on the subject a person who agrees to take a house unfurnished must take it as it stands, and cannot call on the lessor to put it into a condition which makes it fit for living in. Before a person takes, or agrees to take, a lease of a house for a long term, with the usual covenants to keep it in repair during the term, he should have the premises carefully examined and reported on by an experienced surveyor, otherwise he may unwittingly incur very serious liabilities, especially if the foundations are defective, or the house is so slightly and cheaply built as not to be likely to last during

the whole term, without considerable repairs, which is not infrequently the case." Passing from the creation of the lease, we may next briefly notice that the periodical surveys for repairs are frequently not made so often as covenanted for, such inspections being at the discretion of the lessor. They may be relaxed without prejudice by the lessor, who may, possibly, on so determining, consider the stability of the premises, and the reputation of the lessee. Covenants in leases are of such a varied and extensive nature as to render it impossible to notice them in detail in a paper, but the importance of covenants, and the many breaches of them which are ever recurring, prompt me to notice a few by way of illustration. A contract to repair by either party to an agreement or lease may be expressed or implied, although the latter mode is not always desirable. As a general rule it is fairly safe to say that a lessor is under no implied obligation to repair, hence the advisability of reciting any undertaking to repair in the agreement. Where the lessor covenants to do repairs, the condition is implied that notice of want of repair must be given. A covenant by lessor to keep drains in good and tenantable repair has been ruled by Mr. Justice Wills not to extend to the rectification of a structural defect. Woodfall states that "Where the landlord expressly binds himself to do any repairs, there is no implied condition that if such repairs be not done the tenant may quit; but it was held in an old case that the tenant may do the repairs and deduct the expense from the rent, and such would still seem to be the law. At any rate, the tenant could counterclaim for the expense, if sued for the rent." When a lessee

COVENANTS TO KEEP PREMISES IN REPAIR, and to leave them in repair at the end of the term, he must, if necessary, put them into repair, for otherwise they cannot be kept or left in repair in accordance with such covenant. Notice to repair at interim periods need not be given by the lessor if the lessee covenants to at all times keep the demised premises, and all parts thereof, in proper or good repair. If they are at any time out of repair under such a covenant, the lessee commits a breach, for which the lessor may, even during the term, recover damages commensurate with the injury to the reversion. A literal performance of a covenant to repair is not required at frequent or interim periods, but it will be sufficient if, under such, or similar circumstances, the lessee fairly and reasonably performs the covenants. The Courts, rightly, will not regard any such clause in a "vexatious" manner. Notice under a covenant to repair forthwith may invariably be taken to mean within a reasonable period, not immediately; in most instances within three months would be considered to be with all reasonable celerity. A lessee is not liable for breaches of covenant to repair, committed before the execution of the lease by the lessor, although subsequent to the day from which the term is to commence. On a covenant to repair, and keep in repair, it is a breach to pull premises down wholly or partially, or to make structural alterations, as to form openings in a wall, or to remove a division wall which separates a yard from an adjoining property, or to break a doorway through the wall of a demised house into an adjoining house. In the case of painting a house (although usually covenanted for in expressed terms), some degree of painting must be admitted under the term "repair;" as, for instance, painting

necessary for preservative purposes. General covenants to repair, and leave in repair, extend to all buildings erected during the term. But, where in a lease of land with buildings on it, the covenant was to repair the buildings demised, and to rebuild them, if necessary, and to keep the fences in repair, it was held that the tenant was not bound to keep in repair additional buildings erected on other parts of the land. A covenant to yield up in repair all buildings and improvements erected during the term, has been held to be broken by the removal of a verandah, the lower part of which was attached to posts fixed in the ground; but if the buildings erected during the term be solely for the purpose of trade and manufacture, and rest merely upon blocks or pattens, the covenants to yield up in repair all buildings to be erected during the term does not extend to them, although it would be otherwise if they had been let into the soil. On this point, however, many distinctions in favour of trade have been made. Where a lessee agrees to keep in repair the messuages, buildings and premises demised, the same being first put into repair by the lessor, the latter words create a covenant on the part of the lessor to do all such repairs, and also form a condition precedent; therefore, until the lessor has put all the demised premises into repair, the lessee cannot be made liable for non-repair. When a company or public body gives notice to the tenant that they are willing to treat for the purchase of his interest, under the Lands Clauses Consolidation Act, 1845, the tenant is not free from his liability to repair until a conveyance of the premises to the company be executed. There are, apart from express contracts to repair, others which are implied. For instance, in the absence of any express contract to repair, there is the implied liability in the case of demised premises, that the tenant will use such in a "tenant-like" manner. If the tenancy be for years, this obligation is merged in the more definite and statutory obligation not to commit or permit waste. There appears to be no implied contract whatever by the lessor to repair under any circumstances. Yearly tenants are also exempt from any implied liability to repair; the extreme requirement, at any rate, is to keep premises wind and watertight, and to remedy wilful injury. Although somewhat conflicting decisions have in the past been given hereon, the more general custom appears to free the tenant from all liability to repair anything except wrongful damage. I think, however, it is carried to the extreme if, as Woodfall states, "the broken glass of windows need not be replaced by new glass, but that an exclusion of wet by boards, or other unsightly modes, would be sufficient." Presuming that the lease has nearly expired, the next step is the all-important one to both parties, i.e., that of the surveyor's examination of the premises to discover the dilapidations, if such exist. I am afraid that the majority of persons would consider this qualification somewhat irrelevant, but may I add, in justification, that I once knew a case where, at the expiration of a lease, it was readily admitted—after examination of the premises by the architect acting for the lessor—that no dilapidations whatever could be claimed. I grant this to be an exceptional case; and, on the other hand, innumerable instances are on record of lessees who during their term had so neglected the tenements as to allow them to fall into a state of decay, if not collapse, having utterly disregarded their liabilities to repair and maintain, &c.

Baths Competition at Battersea.

The three premiated designs in the Public Baths and Wash-houses Competition at Battersea were on view last week at Battersea Town Hall. Exception must be taken to this system of exhibiting only the winning designs. The value of a public exhibition—beyond the chance it affords to those interested of seeing what is proposed to be done—is that it submits the assessors' award to the touchstone

of public opinion. In such cases as this it is impossible to say whether the best designs have been chosen or not; and this is unsatisfactory, both for winners and losers. With regard to the three designs exhibited, it is difficult without consulting the conditions of competition and the competitors' reports, to see why they have been ranked in this particular way. Presumably there are reasons which are not at first apparent. The first premium is awarded to Mr. F. J. Smith, of Westminster. This design is spoilt by the arrangement of the block facing the front to Battersea Park Road. The peculiar shape of the site, which is at the junction of two

roads forming an acute angle, seems to have been too much for all the competitors. The only one who has made any attempt to grapple with it is Mr. Tiltman, placed third. In this first premiated design it has led to the introduction of diminutive triangular areas, which for light and ventilation are too small to be of any practical value, and to an entrance hall of a shape it would be difficult to describe. There is nothing architectural about this; it is not even practical. The laundry arrangements are better, though even here it is found necessary to have three little areas almost as bad. A 7ft. corridor to the waiting-room of the laundry is a good feature, as it supplies standing room for the perambulators in which the linen is generally brought. The house laundry is placed on the first floor; this, surely, would have been better downstairs, in the basement if possible. The elevation to Battersea Park Road is quiet and inoffensive, and gets a certain advantage by following the street frontage line. The side elevation, however, is spoilt by the introduction of three windows to the baths, with elaborate features over them, not in the best of

side street, and sets back wherever it touches the site line of Battersea Park Road. This cuts up the front elevations, and destroys all breadth and dignity. A better entrance hall has been provided to the large swimming bath, the house laundry has been placed in the basement, and in one or two small points, perhaps, this design scores over No. 1, though in others it is far behind. The crèche, for example, has no outlook—it has one window into a very small area, and is top-lighted. This surely should be a well-lighted, cheerful, and airy room. No. 3, by Mr. A. H. Tiltman, seems in some respects to be the best. The large swimming bath has been brought forward to the Battersea Park Road, and given a slightly splayed end. The angle left at the junction of the two roads has a circular room used as a club room, or artists' retiring room. This arrangement enables the elevations to be treated in a more characteristic way. The lavatory, with its row of w.c.'s, however, is not just the thing to make a feature of on the front elevation. The entrance to the swimming bath is not, perhaps, in the most convenient position. The laundry arrangements are good, and

DRAWING ROOM, "CLARENDON," HELENSBURG. WILLIAM LEIPER, ARCHITECT.

of public opinion. In such cases as this it is impossible to say whether the best designs have been chosen or not; and this is unsatisfactory, both for winners and losers. With regard to the three designs exhibited, it is difficult without consulting the conditions of competition and the competitors' reports, to see why they have been ranked in this particular way. Presumably there are reasons which are not at first apparent. The first premium is awarded to Mr. F. J. Smith, of Westminster. This design is spoilt by the arrangement of the block facing the front to Battersea Park Road. The peculiar shape of the site, which is at the junction of two

taste; they are both useless and pretentious. This design is an instance of what is too often seen in competitions: an attempt to make up for indifferent planning by an elaborate finish on the drawings. The before-mentioned entrance hall of impossible shape has the mosaic floor most carefully put in with lines and dots in different colours. If the time which was wasted in doing this had been utilised to improve its shape, it would have been better for the design. Mr. J. Hatchard Smith has been awarded the second place. This design, instead of following the frontage line to Battersea Park Road, as did the first premiated, is set out parallel to the

there are not so many little areas dotted about as in the others. The crèche is the best of the three, being larger, and having windows to the side street, but ought not its entrance to be under control? In many respects the outside appearance of this design is the most pleasing, and it certainly is illustrated by the best drawings. None of the designs have much pretension to be called Architecture, but this is the case with most buildings of this class. Surely it is not beyond the powers of the architects of the present day to produce something that shall be characteristic and artistic as well as convenient.

A. R. J.

Millais at the Royal Academy.

THE winter Exhibition at Burlington House comprises, perhaps, the most representative collection yet made of the works of a single artist. No modern painter has had so large a public as Millais, though others have influenced more profoundly a smaller world. Millais, in fact, is the mirror of Victorian Art; reflecting in his immense range of power every important phase of experiment and fashion, from the quasi-Classic voluptuousness of Etty to the naïve asceticism of the early pre-Raphaelites, and from the brilliant realism of his few great subject-pictures to his almost undisputed sovereignty (excepting Watts) of contemporary portraiture. The least original and the most impressionable of the pre-Raphaelite brotherhood, Millais seized and made good use of each subjective inspiration that came to him by contact with Rossetti and Holman Hunt; and fell back, when that immediate stimulus was exhausted, upon a technical genius strong enough to carry him on to independent fame. Thus the sum of his achievements appeals to the whole Art-loving community; reaching at one end of the scale that section who care only for the pre-Raphaelite Millais, and regard as apostasy all later work than 1857, and at the other the admirers of his "Christmas Number" period, typified by such nursery trifles as "Cinderella," "Bubbles," and "Puss in Boots." Between these extremes stand the Millais of the sixties, with the sober charm of his illustrations to *Once a Week*, the middle-class sentimental Millais of "Yes or No," "The Widow's Mite," and "Peace Concluded," and beyond them, in the "last stage of all," Millais the pot-boiler, the painter of nonentities in fashionable life. Fortunately, a generous public spirit prevails among the owners of Millais' work, making it accessible for frequent exhibition, instead of being smuggled off to America, like so much of Rossetti's, or jealously monopolised, like the masterpieces of Sandys. The hanging committee have not spared to put his reputation to the severest test by the inferiority of some of the examples included; but it is the highest praise of his successes to say that they bear without injury the presence of his failures. Looking back dispassionately at the pre-Raphaelite controversy in the light of the present exhibits, one may frankly admit that the critics of 1850 had some reason on their side. They stupidly failed to see the spiritual tenderness and pathos of "Christ in the House of His Parents," and to recognise the entirely new note which it struck in the Art of the day; but one can sympathise with their repudiation of its old and wrinkled Virgin and its intolerable red-headed Christ. It is hard to believe that the crude and ungainly "Woodman's Daughter" and "Ferdinand Lured by Ariel" belong to the same period as "Lorenzo and Isabella"—so full of happy characterisation and humorous grace. "The Huguenot" remains without doubt his most completely successful picture, and the most generally loved. It marks the zenith of his intellectual as well as his technical power; and the point at which his too derivative imagination realises itself most fully. Near it must be ranked "The Order of Release," "The Blind Girl," "Sir Isumbras at the Ford," "Ophelia," "The Vale of Rest," "Autumn Leaves" (strangely reminiscent of Fred Walker), and "Mariana." How admirably do these pictures carry their sumptuous burden of colour! And how exquisite are the shimmering greens of "St. Agnes' Eve," the blue and yellow of "Esther," and the russet yellow-brown of the lady's dress in "The Proscribed Royalist"—described by

the colour-blind cataloguist as "red!" On the whole, Millais can hardly be said to have been happy in his models. Striking exceptions can of course be found, as in "The Huguenot" and "The Order of Release," where both sitters are perfectly suited to their parts and to each other; and in "Lorenzo and Isabella," painted at a time of fertile enthusiasm, with a singularly brilliant and interesting circle of friends to draw upon. But the frank ugliness of many pre-Raphaelite models is by no means without its value. The worst of them have inspired work of more artistic merit than the great bulk of commissioned portraiture.

E. W.

Hoardings. AN attempt is being made to improve the physiognomy of the Boulevards in Paris.

The Parisian sense of the artistic fitness of things has been outraged; the authorities have found it necessary to "adopt restrictive measures against the growing use of electrically illuminated and other moveable advertisements in the streets at night." This is as it should be, and the example is to be warmly commended to the authorities in London where, to-day, there are quite as many flagrant examples of this particular form of abuse in advertising as in the French capital. The question of these electrically illuminated signs and symbols naturally leads on to the more debatable one of street hoardings. Hoardings at their best are, of course, a necessary evil. But the evil of their existence might very easily be mitigated. They must ever continue to obstruct, in more or less degree, the public way; but it is not possible, with the present-day boom of the really artistic poster, to so dignify the pictorial representations figuring on our hoardings as to constitute them the wayfarer's "everyday" Art Gallery? This is, perhaps, only a matter of time; as things stand to-day, however, our hoardings are distinctly unsatisfactory. Some of them are very far from being "art galleries"; where they are not distressingly bald they are luridly vulgar. In the matter of eyesores of this nature, the City is perhaps one of the greatest offenders, though it is equalled, if not out-done, by some of the more important thoroughfares in the West End. As though the maintenance of numerous hoardings were not sufficient, it has, in many instances, been deemed necessary to board in upper-story windows in order to lavishly cover them with most appalling examples of the pictorial art. With present powers, it is, of course, impossible to prevent the owner or occupier of a building of some architectural merit from hiding that merit as much as possible behind the colossal gilded letters which reveal to us the "secrets" of the occupancy, but surely it is not too much to hope that some efficient check may be placed upon the ever-increasing enterprise of the advertiser, whose happy medium is a street hoarding. Why not some sort of a censorship? But in this suggestion, perhaps, our ultra-artistic soul soars above the level of commonplace practicability. After all, it is in the public street that one spends a very great part of one's waking life, and it is only a reasonable and rational demand that the Architecture of our streets should not be permitted to suffer at the hands of all and sundry with pills to sell or a dramatic performance to be made known. Hoardings, like the poor, are likely to be always with us, and we can only hope that the really artistic poster will come more and more to the front, that our hoardings will be more and more adorned by the work of the best artists of the day.

H. C.

WAKEFIELD CATHEDRAL.

THE ENLARGEMENT SCHEME.

THE death of the late Mr. Pearson, R.A., will have the effect of somewhat delaying the execution of the enlargement scheme in connection with Wakefield Cathedral, which had been definitely resolved upon as a memorial to the first bishop of the diocese. The scheme was propounded in a report prepared by Mr. Pearson not long before his death:—"It is quite apparent that the chancel, as it is at present while possibly sufficient for the wants of a parish church, is lacking in the importance and dignity, and also in the accommodation necessary to a cathedral. The absence, too, of any chapel for early services and small congregations must be much felt, while the vestry accommodation, even for a parish church, is exceedingly limited. I have endeavoured to provide for all these requirements under one scheme at the east end, so as to disturb the existing church as little as possible, besides which the existing site itself seems to point to the convenience of such an arrangement. Briefly, the design may be described as follows:—

THE EXTENSION OF THE CHANCEL

eastwards, besides giving the increased length to the choir which it so much needs, provides also a retro-choir—a characteristic feature of our English cathedrals. Approached from the retro-choir, and forming a continuation of it, a chapel is obtained, which, together with the retro-choir, will give ample accommodation for early and occasional services. The total extension eastwards amounts to 60ft. The chancel aisles are extended eastwards to the same extent as the retro-choir, and this extension takes the form of north and south transepts with eastern aisles. These transepts, by their spaciousness, will contribute very much to the dignity and cathedral-like aspect of the interior of the church; they are also most desirable features externally, forming, as they do, a break in the long horizontal lines of roofs and parapets. By means of these extensions there is ample room beneath for the chapter-house and complete vestry accommodation, which, owing to the natural slope of the ground, will be well lighted. Access to these vestries from the church is obtained by a wide staircase on the north side, and there is also an external entrance to them on the south side. The present vestry might be used for a bishop's vestry or for other purposes. The extension of the chancel admits of the altar being moved one bay eastward. By this means considerable additional space is obtained.

BEHIND THE ALTAR,

and dividing the choir from the chapel, would be the altar screen. Under the arch on the north side of the sanctuary I propose to place the canopied tomb with the recumbent effigy of the late bishop, where it would occupy the position often filled by the founder's tomb. On the south side, opposite to this, would be the sedilia and credence. The present arrangement of the stalls and choir seats is very unsatisfactory. I propose to take away the existing moveable front row of seats and bookboards at which the choir sit, and so expose to view the whole of the canons' stalls, a large portion of which are old. By this means a great effect of spaciousness will be obtained. Accommodation for choir men and boys would then be found eastwards of the old stalls in a block of stalls three rows deep on either side. This would give room for a choir of 34. The present altar might be placed in the chapel, and its place taken by a new one of a size suitable to the cathedral. It is most desirable that the bishop's throne be replaced by one more in harmony with its surroundings. The cost of the alterations and additions, and the works consequent on them, may be put down approximately as follows:—Structure, £13,500; heating and lighting, £600; bishop's tomb, including recumbent effigy, £2500; stalls for choir, £400; altar screen, £1500; sedilia and side screens, £800; marble floor for sanctuary, £350; bishop's throne, £650; altar £100; chapel fittings, £300; total, £20,700."

Men who Build.

No. 52.

MR. WILLIAM LEIPER, R.S.A., F.R.I.B.A.

THE London whirlpool has not yet, at least, drawn into itself all the talent of the British Isles; still throughout the country there are men of parts who are content to turn their backs on the allurements of the metropolis, artists who find, among their home surroundings, inspiration and opportunities sufficient for their needs, and Scotsmen, unlike Dr. Johnson's Boswell, who can help coming from Scotland. Of such is William Leiper, R.S.A. and F.R.I.B.A.

Born and educated in Glasgow, he served his apprenticeship as architect with Messrs. Boucher and Cousland there. After spending a short time in the offices of Mr. Pearson, R.A., and Mr. Wm. White, F.S.A., in London, and a longer period in Dublin, drawing details for and superintending the erection of Findlater Church for Mr. Heaton, he settled down while still a very young man to practice his Art in his native city. This was about 1860—dates are not a strong point with Mr. Leiper, as he himself confesses, and his work is sufficiently free from a pedantic archaeology to permit him, without the charge of inconsistency, a certain freedom in this respect. The first start was made in partnership with another architect, but the arrangement was of short duration, for then, as now, no doubt Mr. Leiper's art was of too personal a nature to submit to the trammels of co-partnery.

Dumbarton Town Hall was the first joint-work of note, followed by Dowanhill Church, Glasgow, though for the latter the responsibility and credit are entirely Mr. Leiper's. This, a noteworthy first effort, was the forerunner of a series of fine churches for which Glasgow and Scotland are indebted. Through it, also, his work early obtained recognition in the wider world of Art. In order to show the progress of British Architecture at the Paris International Exhibition of 1862, the Royal Institute, at the instance of the French Société, sent over a collection of drawings and photographs, and among those selected from the large number sent in from all over the country, Dowanhill Church was one. This mark of appreciation, it may be readily under-

stood, was a valuable incentive to the young architect at that time, and remains even at the present day a source of pride now that its recipient has become himself one of the "masters."

Those were the days of the Gothic Revival, and for Leiper, as for all the earnest students of his day, every problem in Architecture was

of necessity referred to the practice of the fourteenth century. The influence, already seen in the Dumbarton Hall and Dowanhill Church, was also paramount in the first of a long succession of interesting houses built immediately after, that for Provost David Corsar at Arbroath. Dowanhill Church was followed by others at Brechin, Lanark, and Whiteinch (Glasgow); but, while the Gothic style remained supreme in Mr. Leiper's ecclesiastical work, we find him at the same time breaking away from it in the mansion house of Cairndhu, Helensburgh, built for Mr. John Ure, and in the Partick (Glasgow) Burgh Hall, both in the *Francois premier* style. Of the same period is the mansion house of Cornhill, Lanarkshire, designed for a promi-

nent supporter of the Dowanhill Church—Mr. Alex. Kay—who had there learned to value the architect's ability.

Mr. Leiper's next notable contribution to the Architecture of Glasgow was Camphill Church, an extremely fine design both as regards the exterior and interior, though hurt somewhat as the latter by the gallery round three sides, which, at the time it was built, was regarded as an essential feature in the arrangement of a Presbyterian church. Yet withal, and as the illustrations will show, the architect has been able to reconcile with the utilitarian side of the "Nonconformist conscience" the fine proportions, the dignity, and the ecclesiastical character of the churches of the earlier faith. The tower and spire are of the type of St. Pierre, at Caen, whither Mr. Leiper made a special journey at this time in order to study in detail the original. In the seventies a new influence begins to appear in our architect's domestic work, and one which has ever since largely characterised it, that of the Scottish Domestic—or Baronial, as it used to be called—Architecture of the seventeenth century. "Colearn," Auchterarder, shortly followed by "Dalmore," Helmsburgh, was the first of this type. In the latter may be recognised the work of the mature artist, able to seize and reproduce the spirit of the old work, its picturesque skyline, combined with its dignified simplicity of wall spaces, while at the same time adapting it without loss of effect to modern requirements in matters of ample light and a liberal use of bow-windows, a very different thing to the lover of Scottish Architecture from the affectation of crow-steps and meaningless turrets which the southern designer, let loose in the north, thinks it necessary to adopt, as he does the kilt, when on a temporary visit to the "land of the mountain and the flood." Of the same period and similar in treatment is the design for "Earnock," Lanarkshire, never, unfortunately, carried out, but of which the fine pen-and-ink perspective from Mr. Leiper's own hand is now hung in the Scottish National Gallery as his diploma drawing on his election to the R.S.A.

About the same time, too, or a little earlier—1872—Mr. Leiper built his own charming little house at Helensburgh, of which some characteristic sketches have been published by Mr. Raffles Davidson in his series of "Architects' Houses," and in which he still lives surrounded by his curios and pictures in

HYNDLANDS ESTABLISHED CHURCH GLASGOW: INTERIOR. WILLIAM LEIPER, ARCHITECT.

quiet bachelor seclusion. The first church had been won in competition, and from it recognition and work had followed, so that with that—to some minds—pernicious system of selection our subject could scarce afford to quarrel; but about 1875 a series of disappointments and acts of injustice so harassed him as to make him throw up Architecture, and retreat to Paris in order to study painting. The work in the sister Art then produced showed, as might be expected, marked ability; but, fortunately for the profession of Architecture—which cannot afford to lose its artists—better counsels and an invitation to take up some important work prevailed, and Mr. Leiper once more returned to the old paths. The work referred to was the designing of the "Palace" portions of the ill-fated yacht *Livadia*, built for the Emperor of Russia, but in which Mr. Leiper found ample opportunity for displaying his wonted skill in a new direction.

To describe or even catalogue all the works which followed is impossible in a short notice. Of houses, the most notable have been Kinloch-Moidart (Invernesshire), Moredun (Paisley), Ruthven Tower (Perthshire), with, the largest as regards plan at least, Kelly House (Renfrewshire). Also, in return for the many incursions of the Southerner already referred to, a delightful stone house near Shrewsbury, Rayton Park. Of later churches, the most important has been Hyndlands (Glasgow), an extremely dignified and refined design in red stone and red-tiled roof, with nave, aisle, and square-ended chancel, the large traceried windows and the treatment in other respects based upon Pluscardine Priory.

Within recent years Mr. Leiper's talents as an architect have been displayed in two styles of building, till then outside his ordinary practice—those of the factory and the office block. The opportunity offered him by the fine taste and liberal expenditure of Mr. Templeton, of James Templeton and Co., carpet manufacturers, is not one often to be had by the factory architect, but, at the same time, few could have taken advantage of it as Mr. Leiper has done. The style adopted is Venetian Gothic, the materials Ruabon red brick and terra-cotta, with red stone dressings in the lower stories, glazed terra-cotta of varied colours in the window-shafts, Rust's vitreous mosaic in blue, white, and gold in the tympana of the arches, with the deep frieze, rendered possible by the uppermost story being roof-lighted, in a chevron pattern of yellow and green glazed bricks from Alloa. The building, facing west, and visible from far and near owing to its magnificent open site on Glasgow "Green," when seen either under grey skies or lit up by the afternoon sun, offers a perfect feast of colour to the east-end toilers and a not unfitting indication of the "orient-dyed" fabrics produced within its walls.

The block of office buildings erected by the Sun Insurance Company to house its Glasgow branch is also favoured with a fine site—at the corner of Renfield and West George Streets—and if not so homogeneous and dignified in general conception as the factory it is full of beauty in detail and effective in sky-line. The style offers a good example of Mr. Leiper's treatment of Renaissance in which the influence of many national developments is visible, but in the essence fused and rendered individual. The building is of red stone, while in the interior of the Company's public office a large use is made of coloured marbles in wall panelling and fireplace. Mr. Leiper is still in the hey-day of his powers and full of work; to him, with the buoyancy of the true artist, every new house is to be "the best he has done," and when asked by his interviewer for some "high-sounding theories" to put before the readers of the BUILDERS' JOURNAL, could but characteristically reply that he would offer nothing of the sort, "for" (so giving himself away despite himself) "an hour's work is worth a week's theorising." The house at Stirling, now in process of building, his "best thing yet," shows him still faithful to the old Scottish domestic.

The fine sense of colour and power of design in the use of both figure and ornament shown

in the interior decoration of his own churches and houses has procured for Mr. Leiper the opportunity of doing a considerable amount of purely decorative work. For the stained glass in several churches he has produced the cartoons. The decoration of the St. Andrew's Hall and of many smaller buildings and, quite recently, that of the banqueting hall in the Glasgow Municipal Buildings have been carried out with fine results under his direction.

Our architect is not much of a man for "meetings" or talk, and no seeker of office, but his interest in Architecture and the doings of the brethren is keen. In the early days of his practice he joined the R.I.B.A. as an Associate, sponsored by Burgess and Pearson,

THE ART AND ARCHITECTURE OF PERSIA.

THE origin of the Art and Architecture of the ancient Persian Empire has always presented a problem of great interest, but, at the same time, of considerable difficulty to Orientalists. Two features were especially difficult of explanation, and upon these no light appeared to be forthcoming: Ever since the days when Niehbur and Kerr Porter first made known to Western archaeologists the wonders of the palaces of the Achaemenian kings at Persepolis, students have pondered

DUMBARTON TOWN HALL AND ACADEMY. W. LEIPER, JOINT ARCHITECT.

while in 1881 he became a Fellow. Appreciation and honour from brothers in Art has come to him in another direction, for in 1891 he was elected an Associate of the Royal Scottish Academy, and advanced to the dignity of full membership in 1896.

HERR ERNST HEGENBARTH, a young Vienna sculptor, has completed a bust of Mark Twain. It is intended for this year's Austrian Jubilee Exhibition. The same sculptor has also made a bust of the Emperor, who sat for it several times.

over the sources from which the builders derived their inspiration. That they were the products of indigenous ideas was in every way to be denoted. The earliest of the edifices was erected by Darius Hystaspes, and cannot precede B.C. 500. Yet, says the Echo, in an article on "Persian Archaeology," the Architecture presents many resemblances to the work of the Assyrians in the palaces of Sennacherib and Assurbanipal, which had been destroyed nearly a century before. While the resemblances are most apparent in such features as the winged bulls, and the throne

on which the Persian monarchs are seated, yet there are divergencies in style, especially in the proportions observed, which indicate that the conceptions were transmitted, not by a direct knowledge of Assyrian work, but by an intervening medium. That link was supplied by the Art work of the artists who decorated the palaces and temples of the old Armenian kingdom of Biana or Van. This ancient kingdom, which had derived its Art and letters directly from Assyria after its conquest in the middle of the ninth century, B.C., survived its tutor, and remained independent until the early part of the reign of Darius Hystaspes, when it became one of the satrapies of the great Persian Empire. It was the sight of the great rock inscriptions of Argistis and other Vannic monarchs that inspired Darius to carve the great inscription of Behistun, the Rosetta stone of cuneiform literature. Recent research has afforded a solution of the difficulty regarding the sources from which the Persians obtained their reflection of Assyrian Art as well as their alphabet. Another feature appeared still more difficult of solution. The Architecture of

THE PERSIAN PALACES

is remarkable for the extensive use of the column, and above all for the columned halls or massive canopies supported upon regularly arranged groups of columns. These constructions are described in the inscriptions as *apadanas*, and were peculiar to Achæmenian palaces. They are found in the palaces of both Darius and Xerxes at Persepolis, and consist of groups of four, six, or more columns arranged in groups corresponding to the number of columns, so as to form a perfect square. This form of open-air throne room the Persians transmitted to India, where many fine examples are known, but until quite recently its origin was unknown. Until their contact with the more western and stationary civilisations, the Persians were like the majority of the tribes who have come forth from the table land of Iran tent-dwellers, and the *Apadana* is, no doubt, a modification of the chief *darbar* tent. This explanation is, however, more or less applicable to all early forms of the house. A discovery made by the American expedition, which for five years has been exploring the ruins of the

ANCIENT CHALDEAN CITY OF NIPPUR,

one of the oldest cities in the world, has unexpectedly furnished the source of the peculiar Persian construction. The ancient city of Nippur was built on either bank of a large canal, formerly navigable to the Persian Gulf, now known as the Shat-el-Nil. On the east side was the second quarter round the great temple of Mul-lil, or the older Bel, while on the west were groups of houses in layers, one above the other in stratified layers, from the time of the Seleucidae until the lowest about B.C. 3000. In one large mound here the explorers seem to have struck upon the palaces and residences of some of the princes and wealthy citizens. On the upper surface the explorers found the remains of several Jewish houses, in which several of the curious incantation bowls were found, and the remains of what appeared to be an apothecary's shop, for mortars and a number of bottles sealed with bitumen and filled with various substances were found. These have been removed to Constantinople. Digging through a deep stratum of burials, mostly Babylonian, the excavators came upon

A REMARKABLE EDIFICE.

The first indication was the shaft of a massive brick column nearly a metre in diameter. As such objects are rare, though not unknown in Babylonia, it excited the curiosity of the explorers and work was continued. The first building cleared proved to be a court of columns about 46ft. square—it is important to notice the square form. The pavement was composed of baked bricks of small size, and was 6ft. thick, evidently intended to support some massive building. Around this on three sides ran decorative brick edging, upon which rested four massive brick columns, similar to that described above, resting on square bases bedded deep into the pavement. The corner pilasters

were partly round and partly square. The columns were composed of layers of six bricks, each forming a segment of a circle, with a truncated apex fitting in the centre, and the hollow cone was filled in with rubble. The columns resemble those found by M. de Sarzec at Tel-lo, which bear inscriptions of Gudea, B.C. 2800. The one at Nippur are, unfortunately, not inscribed. On the north-east side

A NUMBER OF OTHER CHAMBERS

were excavated, and the building was surrounded by a massive enclosure wall. The entrance to the whole seems to have been by a porch on the north side. The building was 34ft. below the surface, and on the old Babylonian strata. The question of date was still unsolved. Close to the palace wall, however, a quantity of pottery and glazed vases of the Cossean period, B.C. 1260, was found, and later Mr. Haynes found a large number of tablets stored close by, dated in the reign of Nazi-Murruttash, a Cossean king, who reigned B.C. 1284-1288. These tablets relate to temple and palace revenues, and the place where they were found was no doubt the Record Office of the period. No one can doubt that here we have the origin of the columned *apadana* of later Persian period. The Cosseans were an Elamite tribe, living in the very district where Cyrus, centuries afterwards, ruled. They existed until the later days of the Babylonian Empire. Layard pointed out many years ago the close resemblance between the houses of the Bakhtiari and Yezdis inhabiting the mountains of Kurdistan and Luristan, and there can be little doubt that they, like the columned halls of Darius and Xerxes, are a survival of the old wooden columned reception halls of the Cossean kings of fifteen centuries before the Christian Era. Another of the difficulties of Persian archaeology is thus removed.

PAIGNTON main drainage works were contracted for in the sum of £5000. This has been exceeded by nearly £2000 for "extras."

ART AT EDINBURGH.

ADDITIONS TO THE MUSEUM.

AMONG the principal additions to the Art section of the Edinburgh Museum of Science and Art during the past year are the casts of the colossal statues of Mausolus and Artemisia, which surmounted the Mausoleum at Halicarnassus. They are now set up at the west end of the Great Hall alongside the Ionic column from the same monument, and together serve to give a good idea of the style of both its sculpture and Architecture. A few casts from the marbles, excavated by Sir R. Murdoch Smith during his expedition to Cyrene in 1860-61, and of which 148 were presented to the British Museum, have been added to the collection of classical sculpture. The most important is the portrait bust of the Emperor Antoninus Pius, which was found buried in the debris accumulated on the floor of the Temple of Apollo at Cyrene. This bust was recovered fortunately without a break or a scratch, and gives a perfect portrait of the Roman Emperor. Among the other casts are the Hermes, found some years ago by the German explorers at Olympia—one of the most perfect examples of the work of Praxiteles; the Demeter from Cnidus, probably also by the same sculptor, and which, from its combination of the grief of the mother with the dignity of the goddess, has been happily termed "The Greek Madonna;" and the bust of the bearded Zeus, one of the most treasured marbles in the British Museum.

GOthic WORK.

There is a really wonderful cast of a portion of the re-table in the Church of Notre Dame at Lombeck, in Belgium. The subject is the "Marriage of the Virgin," and the whole work was executed probably by Pasquier Borromans in the first half of the sixteenth century. The figures of Joseph and Mary, the high priest, and the assembled friends, are set under a great spread of Gothic tracery, the under-

ENTRANCE FRONT, "KELLY," SKELMORLIE. W. LEIPER, ARCHITECT.

cutting of which shows not only the extreme expertness of the carver, but also the cleverness of the moulder, who has reproduced its intricacies so perfectly. The model of a portion of one of the rooms from the "Paradiso," of Isabella d'Este at Mantua, is still in progress. The richly ornate ceiling, which has been reproduced two-thirds the size of the original from studies made at Mantua, has been gilded, and now awaits the finishing touches of colour designed to bring the ornament into relief. The pictures by Andrea Mantegna and Lorenzo Costa, which formed the frieze of the wall, though now no longer at Mantua, have been found in the Louvre, and have been reproduced on a scale to fit the present model, so that, when finished, this restoration will bring together the scattered parts of Isabella's charming apartment, and show the camerino more nearly resembling

LIVERPOOL'S NEW POST-OFFICE

IN its external decoration the large post-office now being erected in Victoria Street follows the architectural traditions of the Italian Renaissance style. There are few buildings in Liverpool to record this fashion, and the most perfect—as a copy—stands in St. James's Cemetery, a fitting locality for a fragment of a dead style. But the building under immediate notice is one of many that during latter days have taken up the thread of development where it was ruthlessly broken off when our grandsires took to Doric columns and to tall hats. It may be fairly called English in the design of its general masses and in the fact that the architect has not, in his admiration for the Italian style, gone out of his way to slavishly reproduce it. But in

device one of the four national emblems of the United Kingdom. Their attitudes have a massive dignity in keeping with their structural character, and although, from an æsthetic point of view, caryatides, even the best of them, may be regarded as

DEBATABLE ELEMENTS OF CONSTRUCTION,

these figures amply vindicate themselves by their imposing effect. So much cannot, in justice, be said for the two smaller figures of boys which support the tympanum over the main doorway. Sturdy and strong in character, and unquestionably well modelled, they are nevertheless likely to suggest to the imaginative temperament an inherent unfitness in themselves to support their heavy superstructure. The records of sculpture point to many a similar incongruity wherein a figure has been beautiful in itself but ill

TEMPLETON'S CARPET FACTORY, GLASGOW: FRONT. WILLIAM LEIPER, ARCHITECT.

what it was in her day than can now be seen by the visitor to her Mantuan Palace. The Edinburgh portion of the

PEYRE COLLECTION OF FRENCH FURNITURE AND WOODWORK,

although acquired some time ago, has been detained until this year for exhibition at South Kensington. It has now reached its permanent home in Edinburgh. The addition of upwards of seventy specimens of woodwork has necessitated a re-arrangement of the whole of the collection of furniture, and its proper display has been unavoidably postponed by the delay in the completion of the structural alterations of the building. The large porch of the tomb of Sheikh Salim Chishti, with other specimens of Indian Architecture, have been moved from their former position on the other side of the Great Hall, and several additions of specimens of Moghul Art, notably a cast of the elaborately decorated tomb of Akbar—work of the early seventeenth century—have been made to this section during the year.

the sculptured ornaments that plentifully embellish it, there still lurks a strong Italianesque flavour, especially in the

FIGURES ON THE MAIN FACADE

fronting Victoria Street. The conception of these figures was, of course, due to the architect, but they were all modelled by a young sculptor—Mr. E. O. Griffith. In the designing of these figures, Mr. Griffith was, says the Liverpool Mercury, confronted with a difficult task, of which he has more than satisfactorily acquitted himself. His chief problem was to preserve in them a classic character suitable to the building they were to adorn; to give each an allegorical meaning; to present in each a national type, and withal not to depart from their prime purpose as ornamental adjuncts by bestowing upon them anything like strong individuality. A sufficiently formidable array of limitations, truly! The most important of the figures, in point of size, are the colossal caryatides on the second floor in the centre of the main front. They stand in two pairs, hand-in-hand, supporting the cornice. Each figure is flanked by a shield bearing as a

adapted æsthetically to the office of constructive support allotted to it. The remaining figures are open to no such objection; they support nothing, but rest, graceful and beautiful ornaments, upon pedestals of honour designed for their special occupation. Over the principal door are two distinctive figures, representing respectively Commerce and Navigation. In all of the ten smaller female figures which line the middle cornice of the front of the building there is the same impress of artistry in the design of the conventionally classic garments. These latter figures typify the British colonies.

It is reported that the Belgian Government has given contracts for £5,593,000 to three associated Belgian firms for the new harbour works at Ostend.

A FOUNTAIN has been presented to Manchester by an anonymous donor; it has been erected in Albert Square from designs prepared by Messrs. Thomas Worthington and Sons, architects, and has been formally handed over to the City Council.

PICTISH CASTLES IN SHETLAND.

ON the coast of Shetland there are the remains, in many cases only the sites, of ancient buildings, which of late years have attracted considerable attention. Many of them were large buildings, lofty, circular, of immense strength, and filled, tier above tier, with small rooms, to which a winding-stair gave admittance. Much has been said and written about the purpose for which they were built, and the people who built them. But the period of their erection has receded so far into the remote past, and the people who built and occupied them have so completely vanished that, says *The Scotsman*, not a local trace of either purpose or people remain, except a faint tradition that they were a people of small stature.

THE BROCH OF MONSA

is now the only one remaining in what may be called a state of ruinous preservation. It appears to have been the last broch erected in the islands, and was in a perfectly habitable condition when some of the other brochs (or castles) had fallen into decay. The diameter of the circular site is a little more than 50ft., and the building itself is constructed of schistose stones nearly uniform in size and strongly built without cement. The building rises to the height of 40ft., bulging from its foundation and drawing narrower towards the top, when it again enlarges in a bell-shaped form, making the top overhang the portion of the wall below, thus making the wall most difficult to scale. The entrance door is so low that a person can only crawl through it on his hands and knees, and the wall is of great thickness. The diameter of the area within the walls is about 20ft., and the walls are perforated by three or four vertical rows of holes, numbering from eight to eighteen in each row, and designed to give light and air to their respective compartments. Above the ground floor a door leads to a stone stair which communicates with the rooms, and the rooms communicate with each other. The shell of the broch consists of two concentric walls divided into compartments. The rooms are low, but a few of them rise to the height of 5ft. The building was evidently skilfully planned, and

STRONGLY BUILT FOR DEFENCE.

and in those early days who could the dreaded maritime assailants have been? Defence seems to have been the absorbing aim. The rooms between the walls afforded concealment for the women and children, and places of security for valuables and provisions. The entrance door could only admit one person in a crawling position, and the walls were so constructed that they could not be scaled. A few of the brochs were in such a preserved condition that the Scandinavian chiefs found accommodation in them at the commencement of the Norse period. The Broch of Ester, on the north-west corner of the mainland, must have been in its day one of the most imposing structures in the islands. It was built near the sea and close to a small loch and burn from which the locality derived its name. There is deep water close to the rocks, along which a heavy swell from the ocean always runs, and for a considerable distance there is not the smallest creek where a boat can land. The castle stood towering alone on a long, unbroken line of coast. Before it was removed, after 1840, it formed a huge, unshapely mound of stones, and yet, unless the stories handed down were purely imaginary, it was inhabited by human beings, living apart from their neighbours, as late as 1715. Its size had been such that it furnished stones for building a park dyke 6ft. in height and a mile and a half in length, and the materials are not yet exhausted. Many of the stones were of such size that they had to be broken in pieces before they could be removed. Like Monsa, it was circular in form, and had

CONCENTRIC WALLS

with compartments between them. Traces were found of the winding-stair leading to the

various rooms, and the underground passage leading from the area inside the door to a place some distance from the building, was easily traced. As the excavations went on, several articles, such as querns, knocking-stones, stone mallets, hatchets, corn-hooks, knives, weapons, heaps of shells and fish bones, bones of sheep and poultry, and of oxen of a large size, were found. There were also found a rude kind of pottery, and various other articles which, in the present day, would be considered of much value. Unfortunately the landlord, though a life-long student, was not interested, and the workmen looked on the finds as unhallowed things, and threw them into the sea. A similar fate befel the articles found in the ruins of all the brochs when the stones were removed for building purposes. There were between

TEMPLETON'S CARPET FACTORY, GLASGOW:
SOUTH END. W. LEIPER, ARCHITECT.

twenty and thirty brochs in Shetland. Several on the coast, and all in the hills and on the holms in the lochs, were of small size, but the whole were built on the same plan, and with the same precaution. Some of the hill brochs must have fallen into decay when the islands were colonised by the Northmen, because Norse names, signifying a large cairn or heap of loose stones, were applied to them. To give an opinion as to the builders and occupiers and date of building of the brochs is to tread on debateable ground. Very seldom will two men who have given attention to them be found to agree. The materials on which to found an opinion are too scanty. The buildings themselves furnish the only data. Their builders must have been men of low stature, of great personal strength, foreseeing, skilled builders, considerably advanced in civilisation, and liable to sudden attacks from dreaded and powerful enemies.

IN DANGER OF DEMOLITION.

POSSIBLE FATE OF THE CRYSTAL PALACE.

THE Crystal Palace, in all its magnificence, stands in real danger of demolition. As a private enterprise it is, as is well-known, unremunerative, and the fact that the owners are ready to sell it, together with the appropriateness of acquiring the Palace as national property in commemoration of the Queen's Jubilee, has fostered a movement for its purchase from private hands. "The municipal authorities throughout England and Wales will," writes Mr. C. William Tagg, clerk to the Camberwell Vestry, "shortly have before them copies of resolutions unanimously adopted by a conference convened by the vestry of Camberwell in favour of the Government acquiring the Crystal Palace. The Palace, which has for over forty years been to all intents and purposes a national institution, is not remunerative as a private enterprise, and runs the danger of being shut up unless some public assistance is obtained. It was felt that its public acquisition would be a fitting memorial of Her Majesty's reign, as the buildings were originally erected for the Great International Exhibition held in 1851, specially associated with the memory of the Prince Consort. Before referring to the progress of the movement for purchase, and the sympathy which it has awakened, permit me to give a few facts about the present position of the Palace. Its position as a great national centre for pleasure, and one of the best places for popular sports, is well known. It is

THE ONLY BUILDING IN THE COUNTRY capable of holding huge national demonstrations. National temperance assemblies are sometimes held at it, attended by 50,000 people, and it has been the scene of the annual reunions of co-operative and friendly societies and other organisations. As a place for holding exhibitions and shows it is unequalled, while it is the only building in the country large enough to hold great choral festivals, and has therefore been chosen as the scene of the Handel Festival. As a centre of entertainment it draws visitors from all over the country. While its usefulness in these directions is generally known, it is not so well recognised that the Palace carries on an important educational work. As to its general utility as a national institution, I cannot do better than quote the author of 'John Halifax, Gentleman,' who in a work published in 1888,

Concerning Men, and other Papers, under the title 'Story of an Old Friend,' makes the following remarks with reference to the Palace: "Does the nation understand what it would lose were the Crystal Palace to be swept away, and how much both upper and lower, i.e., educated and uneducated, classes are interested in its preservation? First the former; nowhere in England is there such a fine collection of casts from foreign antiques, many of them the only casts ever taken, and of curious mediæval monuments, artistic and architectural. Some of these, spread about the dim and

SELDOM VISITED SIDE COURTS,

would repay an artist for weeks of study. Then there is the School of Art, Science, and Literature, now in its twenty-seventh session, each session having counted at fewest, 500 students. During the past fifteen years no less than 9000 students, guided by thirty-three instructors, have attended the classes. The School of Practical Engineering, established in the grounds in 1872, has educated 900 young men, and is still advancing, paying its own way, and giving complete satisfaction. There is also . . . a reading-room, a library for reference and lending, under certain restrictions; Oxford and Cambridge local examinations, and daily classes of all sorts, from the higher education of women down (or up) to cookery or dancing. All these educational institutions are worked at a money profit, and do not cost the Company anything, while the Art and Science collections thus utilised are in some sort an endowment. Finally, where can the true musician, be he

RAYTON PARK, NEAR SHREWSBURY. W. LEIPER, ARCHITECT.

professional or amateur, find such music, not only on Saturdays, but every day and all the year round, as he finds at the Crystal Palace." I may state that the capital of the Company is £1,557,718. It is not suggested that the shareholders should be bought out, and there is no desire on their part to make the sale a commercial transaction. They are prepared

TO SELL THE PALACE

for half the capital of the Company, but, of course, no negotiations have been entered into. There is, however, the greatest danger (the certainty, I might say) that, unless something is done, the magnificent buildings will be pulled down, and the site sold for building purposes. A conference has been held between local authorities in London, which showed that they are expecting a great deal of sympathy for the acquisition of the Palace. A deputation waited upon the Lord Mayor at the Mansion House, suggesting a national conference of municipal authorities to consider the proposal. His Lordship consented to call such a conference early this year. As to where the money should come from for the purchase of the Palace, and by whom it should be managed, is a matter for future discussion."

THE great fortifications which surround Paris and give it the appearance of a walled and moated mediæval city have been a military fetish for many years. But the walls have long since ceased to serve any useful purpose—military or otherwise—except to act as convenient barriers for the octroi department. Yet not until ten years after the war was anyone bold enough to suggest the demolition of the so-called fortifications, and it is only now that the Minister of War has decided to remove part of them. General Billot has prepared a project, and sent it to Parliament for demolishing the walls on the west side. This is only a half measure. The late Director of Public Works—M. Alphand—had a grand scheme for removing the whole of the fortifications and encircling Paris with a great boulevard 200ft. wide, which would have been an open space in itself. This scheme only continued the evolution of the city. The original Paris was confined to the little island in the Seine of la cité. It was a natural stronghold in mediæval times. When the city extended, the first wall was on the site of the inner boulevards. The outer boulevards mark the site of a further extension. The existing walls prevent Paris from extending. Over 6000 acres of valuable land are wasted with the useless walls, and more than half this land would make valuable building sites, which would nearly pay for constructing a new boulevard.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

January 12th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Lyric Club of the A.A. held its eleventh cinderella dance at the Holborn Restaurant on Friday evening. The function was a big success—that goes without saying, for the A.A. is as thorough in carrying out the social side of its programme as it is in dealing with the educational side. The Architectural Association shows no inclination to neglect what has always been an important factor in its success, and what was one of the primary reasons leading to its foundation—the meeting together for friendly intercourse and mutual help. The Lyric Club does much to maintain the freemasonry of the Association, and it was the means of bringing together a great array of A.A. talent for the most part of the younger order, at the Holborn Restaurant, on Friday. The meeting was bright, if not brilliant, and was carried on with that zest which one expects from the ardent A.A.

It is announced in the current number of Saint George, the journal of the Ruskin Society of Birmingham, that Mr. W. G. Collingwood, M.A., has recently received a letter, of which the following is an extract:—"I am glad to say that Mr. Ruskin's health is much as it has been during these later years. He still takes his daily walks, sees his personal friends, and spends much time in reading. But it does not seem to be understood by the public that this comparative health depends upon his being kept from all unnecessary work. He directs his own business, but is obliged to decline correspondence, and cannot reply to the many letters which still come asking for

his intervention in public matters or for private advice and assistance."

CARDIFF, which is about to erect for itself a new Town Hall and Law Courts, is proposing, in connection with its new tramways scheme, to repave from kerb to kerb the streets to be traversed by the tramways, as well as some other thoroughfares, with Australian hardwood blocks, at a cost of £261,000. This decision has been arrived at after a consideration of the results of experimental wood-paving already carried out in the town. More than that, the Cardiff people are going to import the hardwood direct from the West Australian plantations, erect machinery for cutting up the timber into blocks, so saving the expense of middlemen, and by this means cultivate an import trade in the Australian hardwood, making Cardiff an important centre for the distribution throughout England of the paving blocks.

THE Council of the Royal Academy has issued notices to the members requesting their attendance at two general assemblies for the purpose of electing no fewer than seven academicians and associates. The first assembly, at which two academicians and two associates will be chosen, is to take place on the evening of January 19th, and the second, for the election of two academicians and one associate, will be held a fortnight later, on February 2nd. For the academicianships, Mr. Gregory, Mr. Swan, Mr. Seymour Lucas, and the off-defeated Mr. Leader are still in the running, but a new favourite has recently appeared in the person of Mr. Ernest Waterlow, who, three or four weeks ago, defeated Professor Herkomer by a single vote in the contest for the presidency of the Royal Society of Painters in Water Colours. Apart from his qualifications as painter (says the Chronicle), Mr. Waterlow is extremely popular among his fellow artists, and personal popularity is no small factor in the determination of an Academy election. Another landscape painter, Mr. Alfred East, is likely to secure an associateship, but the first of the minor honours is almost certain to fall to Mr. La Thangue, one of the most "coming on" of our younger painters, who was defeated by a very small majority at the last election of an associate in January, 1897.

A BILL to incorporate the New Cross and Waterloo Railway Company has been deposited in the Private Bill Office. The proposed Company seek power to construct an underground electric railway, commencing at a point in Old Kent Road near the bridge carrying the London, Brighton, and South Coast Railway over that road, and terminating under Waterloo Road, near the point where the South Eastern Railway crosses that thoroughfare. The Bill contains provisions prohibiting the construction of ventilators, or other openings, in any road or footway, and also the exhibition of advertisements upon any part of the works.

THE West Riding Council propose to erect an asylum at a cost of £77,000 at Scaleborough. The plans are before the Lunacy Commissioners, the drawings having been prepared by the West Riding surveyor. The new building will provide for 174 patients, and will comprise administrative, sick, infirm, and acute blocks, with lavatories and all the latest appliances of scientific and medical research, a lecture-room, recreation-room, billiard-room, and special apartments for ophthalmoscopic, physiological, and bacteriological work.

OF the various schemes suggested for the amendment of the burnt-out area in Cripple-gate, but one has already been tentatively adopted by committees of the Corporation and the London County Council, which latter body will in all probability, in the event of its final adoption by the respective bodies named, contribute half the cost of the improvement. It is an essentially Metropolitan improvement, which has been advocated for the past twenty-five years. It provides for a main thoroughfare, 60ft. in width, extending from Fore

Street to Little Britain, and leading right and left through the open space facing St. Bartholomew's Hospital to Giltspur Street and High Holborn, thus forming a continuous main thoroughfare from Hyde Park in the west of London to Bishopsgate Street in the east, and avoiding Moorgate Street, Cheapside, Cannon Street, Lombard Street, and contiguous thoroughfares. That some such scheme has been in contemplation for some years may be gathered from the fact that five years ago the premises in Old Broad Street and Wormwood Street were set back for the widening of those thoroughfares. It is also the intention of the Bridge House Estates Committee to widen that part of London Wall extending from Blomfield Street to Moorgate Street. In course of time, therefore, the thoroughfare will extend eastward as far as the Tower Bridge, and the improvement will be one which cannot fail to give the greatest satisfaction to Londoners. This in reality is the aim of the promoters of the scheme, who realize that such a thoroughfare would not only greatly relieve the congestion of traffic in the Strand, Fleet Street, and Cheapside, but provide a much shorter route for the traffic. It is, of course, an improvement which must be gradually effected. But with the widening of Jewin Street, which might be commenced at once, and the construction of a new and continuous thoroughfare from the Aldersgate Street end of Jewin Street to Little Britain—for which an Act of Parliament would be required—a new communication would be opened between the east and west of London, which would obviously be an immense advantage. This scheme does not touch the question of the narrow and dangerous streets destroyed by the fire last month.

"ANYTHING more deplorable than the condition of the streets of London during the variable temperature we have experienced within the past fortnight," writes a correspondent, "it is difficult to conceive. I notice that indignation meetings are held, and protests made against the use of asphalt, and the only alternative paving suggested seems to be wood. We shall soon have the estimates of paving for the coming year laid before the various vestries. Why, then, may we not have a fair trial given to the material of the Cork Pavement Company, which has lately been laid in Basil Street, Chelsea, besides several other districts in London, and which, I am told, is a delightful pavement to drive over, possessing as it does the qualifications of being practically noiseless, entirely non-absorbent, and therefore quite sanitary? Then, best of all, besides giving a secure foothold to horses, it has, I believe, the merit of being extremely durable, at about the same cost as hard-wood paving."

THE safety of the public at Olympia has been a matter of grave consideration to those who made the arrangements for the "Greatest Show on Earth," and, with the approval of the County Council, four huge erections or screens of asbestos have been put up as the best method of ensuring the public safety from fire. These asbestos screens, measuring 130ft. by 90ft. each, are made from what is called "Danville Asbestic," a material that is now attracting widespread interest amongst engineers and architects for its marvellous properties as a fireproof protection. After the recent terrible fires, this forms an object lesson of how to prevent their recurrence, and the fact that the management at Olympia have gone to the trouble and expense of putting up these screens, is one that will greatly enhance the sense of security of those attending the brilliant spectacle at the World's Show.

RESIDENTS in Stratford Place are not at all disposed to submit without contest, to the utmost of their lawful power to the vandalism which proposes to mar the fine symmetry of the Brothers Adam's Architecture by the addition of a story to a house there, which has long remained unoccupied and has now been taken by a dentist. Few corners of the Metropolis possess more interesting historical associations

than this, for here in the fourteenth and subsequent centuries was the conduit-head of the City water supply. Over this stood a very stately banqueting house, to which the Lord Mayor and Sheriffs were wont to repair for refreshment after hunting in Marylebone Fields. Edward Stratford, second Earl of Aldborough, obtained the ground lease in 1775, renewable for ever from the Corporation, and built the present houses from the Brothers Adam's plans, who thus had one of their greatest opportunities of carrying into effect their favourite idea of making the individual residences a part of the greater whole.

SIR WALTER BESANT has another article on the history of London in the Pall Mall Magazine New Year's number. It is chiefly occupied with an attempt to depict the condition and probable outward aspect of the tract of country described as "Southwark Marsh" in prehistoric and early historic times, and to show how the town of Southwark must have begun to exist. One of the first conditions was the embanking of the river on that side, which, Sir Walter thinks, must have preceded the erection of the first London Bridge, though that is nearly nine centuries ago. But the embankment which first made it possible to live in Southwark and Lambeth marshes was part and parcel of a vast work whose history, strange to say, is entirely unknown. Had it taken place during the period of the Roman occupation, Latin writers could hardly fail to have made some mention of it; had it been of somewhat later time, the earlier chroniclers must have referred to an enterprise so stupendous. But not even tradition points to the race or the means by which it was accomplished.

ANOTHER Old English room has been set up in the western arcade of the south court of South Kensington Museum, by the side of the "inlaid room" from Sizergh Castle. It is from an old house, now pulled down, at

Bromley-by-Bow, and belongs to the early years of King James I.—the date 1606 having been carved on the outside of the house. The spacious stone fireplace has over it an elaborate mantel-piece in oak, with the Royal arms very boldly carved. The ceiling bears, in the centre, the same arms with the initials "I.R.," and is covered with fine strapwork ornament, having floral enrichments and medallions containing heads of ancient warriors. An extensive alteration was made in the last century, whereby the room was shortened and the panelling was shifted to suit the new conditions. A few mouldings and door heads of the latter period have been left out, as they were in pine wood, and consequently appeared incongruous by the side of the old oak. The room is, therefore, more nearly in its original form than when demolished. Specimens of furniture of the period have been taken from the museum and arranged in the room in order to give it a furnished aspect.

THE arrangement of two rooms in the cross gallery, connecting the Indian section and science collections, has now been completed. The first room on descending the staircase is devoted, for the most part, to Cairene Art. Three of the well-known lattice windows are shown here with their curious projections for holding water-bottles. On one side is a mosque pulpit of wood decorated with delicate carved ivory plaques. Specimens of doors with similar ivory plaques are arranged in cases against the walls; casts of architectural ornament from the mosques of the Sultan Hassan and Kait Bey, and the Wekaleh of the latter Sultan, fill the upper parts of the walls and the corners of the room. In the second room are textile fabrics and embroideries from various parts of the Turkish Empire. To the left are brocades and velvets, probably from Broussa, while to the right are the remains of seventeenth century brocaded dresses, from the tombs at Constantinople, of young princesses. The screens contain em-

CAMP HILL CHURCH, GLASGOW: EXTERIOR. W. LEIPER, ARCHITECT.

broideries in endless variety of stitches from Syria, the islands of the Levant, and other parts of the East. Against each of the long walls is one side of a room from Damascus, one of the early eighteenth century, and the other about fifty years later, with their quaint cupboards and recesses. On the ground floor of the Indian section an important addition has been made to the plaster casts by a collection of ornamental details from the palace of the great Akbar at Fathpur Sikri, near Agra.

"It is literally impossible to estimate the irreparable damage which has been wrought among our ancient buildings during the present reign," writes Lord Balcarras in the *Land Magazine*. "It is true that nowadays there are few places in the land where derelict castles and churches are used as quarries, as was the practice formerly; but the tendency of the times to restore everything, to transform our heritage from the past into spick-and-span modernisms, seems to be almost as deplorable. Few will deny that our ancestors made buildings of great and abiding beauty. Why are people so ready, so willing, to mutilate such things, either by wanton demolition or by thoughtless alterations and additions? And here, at the outset, let me dispel an objection which has been frequently aimed at the Society for the Protection of Ancient Buildings. It has been argued that it wants to keep churches in ruins, to prevent their being warmed, roofed, or cleaned—in fact, to make them useless. Such charges had to be rebutted in old days, but people are now beginning to realise that the Society was never guilty of such proposals. Its object has always been to preserve, and nothing more; simply to prevent needless additions which would deface the original structure, and wherever possible to maintain the old building in entirety. It is possible to warm a church without erecting forests of stovepipe in the nave. To repair a leaking roof it is unnecessary to alter the exterior character of the building; and in order to clean a church there is no need to strip it of wall paintings, monuments, paneling, or internal decoration.

"Much harm has been done in the great centres of population; yet more harm has been, and, indeed, is being done in our country districts. The parish church is the first to suffer. A Parliamentary return was issued a few years ago which showed that something over ten millions sterling had been spent on the restoration of churches during a period of eighteen years, ending in 1891. A large proportion of this was spent on country churches. This represents a portentous amount of destruction. Restoration is, of course, necessary, and sometimes imperative; but it should take the form of protection and reparation, rather than rebuilding. However, the church is by no means the only architectural feature of our country parishes. The records of the society show that other objects of an essentially rural nature have been dealt with—old village inns, for instance, wells, barns, bridges, mills, and manor houses. Upon these much of the charm and variety of country life depend. They are not only valued relics of bygone days, but they also give character and distinction to a neighbourhood; and let it be remembered that the pleasure they afford is not confined to one county or to one generation, for they are a potential joy to every student, however humble, and also to posterity."

THERE is, fortunately, some proof already that the importance of decoration and design is becoming an article of the artistic faith. Associations are springing up for the promotion of the interests of artists who are willing to devote themselves to the applied arts, and these associations will soon occupy the ground from which the picture exhibiting societies are being driven step by step. The activity of one of the newest organisations, the Society of Designers, gives evidence of the vitality of this movement. This Society exists to advance the arts of design, and to make intelligible the claims and responsibilities of designers; it is open only to men who are actually experienced in the various branches of applied art; and it

undertakes, by means of lectures and exhibitions, the task of spreading abroad a knowledge of the best principles of aesthetics. The lecture recently delivered by the President, Mr. G. C. Haité, who speaks with the authority of a man who has made his position secure both among designers and painters, opened the proceedings of the Society for the coming year with a very definite assertion of the claims of design, and in the work of propagandism his lead is to be followed by other specialists who will handle with equal authority their own subjects of study.

In this development is the chief promise for 1898. What the Society of Designers is doing, says the *Globe*, and what other Arts and Crafts Associations and Guilds of Handicraft are actively advocating, is the building up of a foundation for an Art which will take the place of those forms of picture-making which have ceased to have any influence over the public. Other individual decorators, like Sir Edward Burne-Jones, Sir W. B. Richmond, Mr. Walter Crane, and many more, are, by precept and example, spreading a new artistic conviction far and wide. Before long the annual retrospect of Art achievement will not be a record of a few works completed in decoration, and a lamentation over the poverty of the results in pictorial Art; but a list of successes in many living and popular crafts and varieties of design, supplemented by a brief account of the works of the few great picture painters, whose commanding specialism justifies their devotion to a branch of Art in which success is possible only to the very few.

A NEW steel arch bridge, to take the place of the upper suspension bridge across the Niagara gorge, is in process of erection by the Pencoyd Ironworks of Pennsylvania. The site of the bridge is opposite the two great falls, and, owing to its position, it will connect the two free parks at Niagara, the Queen Victoria Park on the Canadian side, and the New York State Reservation on the American side of the river. The abutments of the new bridge were built in 1895. They are four in number, two on each side of the river, the members of the respective pairs being 67ft. apart. They are magnificent examples of ashlar masonry, the stones used in their construction weighing from two to six tons apiece, while the coping stones measure each 7ft. 6in. wide by 2ft. in thickness. The Niagara gorge is at that point 1268ft. wide, and the span proper of the steel arch will be 840ft. The bridge will be about 50ft. wide. The centre of the Canadian end of the bridge will be on the exact centre of the old suspension bridge, but the centre of the New York State end will be carried a little to the south of that bridge, so as to avoid the entrance to the tunnel constructed by the Niagara Falls Power Company. The work of erection, an engineering feat of no common order, is to be completed next spring.

"THE most magnificent Nonconformist church in Europe"—so described in the "Guide to Paisley"—is the Coates Memorial Church, Blackburn. The church, the cost of which is variously estimated from £100,000 to £150,000, was commenced as a memorial of the late Thomas Coates, of thread fame, in 1886, and opened for worship in May, 1894. The building is of pure Gothic character, built on the cathedral plan, with nave and aisles, transepts and choir, and is surmounted by a massive square tower, rising from the intersection of nave, transepts, and choir, which is crowned by an open lantern and spire rising 220ft. above the street level. The church, though very large, is seated for only 900 worshippers, the aisles being used simply for passages. In all its fittings, accessories, elaborations, and decorations, the utmost refinement and finish is displayed throughout. The carvings in wood, stone, and marble are of the most exquisite description, and must be seen to be understood. The marble pulpit and baptistery, the carved choir-stalls, the great organ by Hill, the lovely windows, and the elegant suites of rooms for candidates, pastors, choir, and people are among the wonders of this ecclesiastical palace, the

spacious halls, which can accommodate 900 people, adding to the sense of space and perfection which impresses every visitor. The surrounding grounds are beautifully laid out, and afford every opportunity for studying the external aspect of the superb structure.

RAPID progress towards completion is being made with the extension of the Great Central Railway. The Central Station, Nottingham, is in the centre of the town, and a large and commodious hotel is in course of erection at the entrance. Stations are also being erected at Arkwright Street (Nottingham), Ruddington, East Leake, Loughborough, Quorndon and Woodhouse, Rothley, Belgrave and Birstall, Leicester, Whetstone, Ashby Magna, Lutterworth, Rugby, Willoughby, Charwelton, Woodford, Culworth, Helmdon, Brackly, Finmere, and Calvert, the terminus being at Marylebone Road, London. The London terminus station, which is being constructed of red brick, will have a frontage of 325ft., and will contain dining and refreshment rooms on the ground floor, with offices, &c., on the first floor. Between the station buildings and the arrival and departure platforms a space of 100ft. in width, and extending the whole length of the frontage, is being provided.

On the 4th inst. it was reported that Mr. Beaumont, who was appointed to consider the competitive plans for the new technical school and public library at Colne, had awarded the first prize of £50 to Messrs. Woodhouse and Willoughby, Manchester, and the second (£35) to Mr. T. A. Buttery, of Morley. A sub-committee was appointed to consider the competitive plans and report thereon.

THE new theatre at New Cross, which will accommodate some 3000 people, is now open. The building, which faces the Broadway, is from a design by Mr. W. G. R. Sprague. Externally it is worked in Portland stone in a free Italian style, and generally the edifice compares favourably with most London theatres for appearance and accommodation. The decorations, which have been carried out by Messrs. J. S. Waring and Sons, are in the style of the early Italian Renaissance, the principal feature being the adoption of the vertical lines of the building as the basis of the ornamentation instead of the horizontal lines now generally accepted. The prevailing colours are rich, warm red-browns, and gold. Over the proscenium is a representation of the prow of the Pelican, the vessel in which Sir Francis Drake made his famous voyage round the world. There is no seat which does not command a good view of the stage. The theatre is lighted by electricity, Messrs. Verity, P. Brotherhood, and D. Paxman, under the directions of Mr. E. W. Bowles, supplying the generating plant, &c. Round the centre cluster of lamps are twelve shields bearing the arms of Queen Elizabeth, who, somewhere near, addressed the men of the ships which defeated the Great Armada; of Peter the Great, who learned the art of shipbuilding in Deptford; of Shakespeare, of Chaucer, of the county of Kent, and the City of London. The act drop represents Peter the Great at work in a Deptford shipbuilding yard, a copy of the well-known picture by Seymour Lucas, A.R.A. The comfort of the audience has been carefully studied in every way.

THERE is a Welsh picture of considerable interest in the exhibition at the New Gallery. It is Dante Gabriel Rossetti's design for the altar-piece of Llandaff Cathedral, and was lent by Judge Lushington. The picture is a water-colour in three compartments. In the centre one is represented the adoration of the Magi; in the left one the youthful David as a shepherd, with a crook and a sling; in the right one David, older, and as a king.

MR. ALFRED WATERHOUSE, R.A., LL.D., who acted as arbitrator in the recent competition for the Cardiff Municipal Buildings and Law Courts designs, has been appointed treasurer of the Royal Academy, vice Mr. J. C. Horsley, R.A., resigned. Mr. Waterhouse was elected A.R.A. in 1878, and R.A. in 1885.

EVOLUTION OF STYLE IN ARCHITECTURE.*

By LESLIE OWER, F.R.I.B.A.

WHAT do we mean by *style* in Architecture? Style is that general character which the Architecture of a great nation presents to us when it has arrived at its highest perfection. It may be said that no great nation has ever had two styles growing and progressing at one and the same time. When what we understand by a *style* has been developed, it has only been by the continued and sustained labour of centuries along a definite line. It would seem that not by any other means is that perfection to be arrived at, upon which succeeding generations will confer the honoured name of a style of Architecture. Sometimes we do find that a great people were working in two styles, as when Gothic tried to find a footing in Venice and Italy, or the Moorish in Spain, but in such cases either one or both styles were in decadence, or Architecture was at the time, either from political causes or lack of public enthusiasm, in a state of coma or transition. This seems to be the condition of affairs in our time, and history would seem to show that until we get a firm hold of a leading idea in our Architecture, we shall not make progress in building up a British style. Vacillation from Classic and Renaissance to Gothic and back to Renaissance again, with all its varieties of Queen Anne, Georgian, Jacobean, half-timber work, &c., and then to divide up into the two pretty well defined lines of Gothic for Ecclesiastical buildings and Renaissance for everything else, does not appear to give promise of any great achievement for some generations to come.

FOUNDING THE STYLES.

In the development of what we call the styles of Architecture, the nations who have the credit of them had no special advantages which our age does not possess; indeed the opposite was rather the case. Each simply wrought out its desires and aspirations all unconscious that it was "forming a model for the mighty world and marking the fair beginning of a time." Precedent and tradition were their only schoolmasters, and very limited the knowledge they could impart. Unlike our days of intercommunication and architectural illustration, the opportunities of seeing and learning about Architecture were confined to very restricted limits. Possibly to this may be due in great measure the perfection to which they wrought up the particular style which lay to their hands, all undistracted by such an *embarras de richesses* as we have fallen heir to. Those styles were developed under varying conditions and influences favourable and adverse, some similar to what we experience and some entirely different, but all tending to impress an individuality on the perfected style. But the influence which probably most of all produced the great results we admire in all styles, was the whole-hearted enthusiasm of the nation in the works they had in hand. Their great buildings were subjects of national interest and national pride. Peer, priest, and peasant alike were under the architectural spell, and laboured to forward the realization of their great ideas. In a volume, dated 1856, of the "Transactions of the Architectural Institute of Scotland," an article appears by a well-known artist (Mr. Patrick Allan Fraser, of Hospitalfield) under the title "The Principle of 'Usefulness' as a Governing Feature in the Architecture of the Ancients." The writer says: "The great difference between ancient and modern Architecture, and the great hindrance to our improvement in architectural practice, will be found in our almost total disregard of that which constituted the controlling principle in olden times, viz., 'Usefulness.'"

BEAUTY AND TRUTH.

Mr. Fraser goes on to say, "Every arch, every column, and every corbel were truthfully necessary, and so used by those who, conscious of their creative power, sought not the aid of that truthless copyism which has always, where-

ever practised, led to the ruin of true constructive science." "Architecture to become great must be useful and truthful." It appears to me that this is a maxim which architects have some need to be reminded of now and again. How often do we see useless and incongruous features applied to buildings by way of decoration! How often a straining after novelty which results in eccentricity instead of beauty and fitness! Features and ornamentation produced under such circumstances can have no permanence nor place in building up a style of Architecture, and those who practice their Art in that fashion are not amongst wise master builders. Let us away with eccentricity, fadism, and even with somewhat of the over picturesque, and strive to design our buildings in the spirit of the ancients, useful and truthful, causing them to proclaim their purpose and record the history of the people for whom we build.

INFLUENCE OF RELIGION.

It is a noteworthy fact, and one which shows how deeply the spiritual is seated in man's nature, that religion has in every age been the most powerful influence in developing all that has been best of Architecture. Men under its inspiration have always surpassed themselves, having piled up the Pyramids into the most gigantic monuments which ever have been, and, probably, ever will be, erected; elevated the noble Parthenon on the Acropolis of Athens; thrown the dome over St. Peter's at Rome, and tossed the graceful spires of Cologne Cathedral 400ft. into the blue vault of heaven. In our day, religion has not that great influence in promoting Architecture which it had in past ages. Our unfortunate divisions into numerous sects is fatal to that great and combined effort which produced the magnificent temples of former ages, and thereby gave opportunities for the realisation of the people's highest ideals in Architecture. Every age has its particular bent, and that of our's does not seem to be Architecture. In Mr. Blomfield's new book on the Renaissance in England, he says: "The Arts do not at this moment express the finest intelligence of the country. That intelligence is concentrated in other channels, and has left its mark in science, in immense commercial enterprise, in almost every other form of activity other than the arts. The latter are not at present regarded as worthy of serious and sustained attention, and until some reasonable standard of judgment has grown into recognition among educated people, it is not likely that there will be any general improvement in English Architecture." That there is much truth in those words no one will deny, though the view of the case is rather pessimistic. I hope we may venture to think that educated people do take an interest in our Art; and in the spread of education, and the great facilities now offered for travel, which is the great popular educator in Architecture, we may expect to find a powerful influence on our Architectural style. So far as the practical is concerned in our Architecture, we are not far behind. If the average Englishman (and Scotchman, too, for that matter) does not care to understand what Art is, he is all there when considering questions of comfort. In our rigorous climate we spend much of our time indoors, and thus it comes that in no country do we find the art of making a comfortable, convenient, and healthy home so well understood as in Britain.

INFLUENCES MODIFYING STYLE.

There are many influences at work in the development of style, and we might briefly consider a few of the more important. One of the most important is climate. The idea which lies at the root of all building is that of providing shelter from the elements, and therefore we find the Architecture of all people varies with their needs in this respect. In sunny and dry climates roofs are generally flat, while in wet climates they have to be made sloping to throw off rain and snow. In this feature alone we find a marked difference between the Classic and Gothic styles, the latter having been perfected in the most rigorous climate. Where the sun is hot and light strong, thick walls and small windows are found, and shady colonades and open

courtyards are necessary. Cornices with heavy projections giving intense shadow are suitable for sunny climes, while the broken skyline and strongly marked vertical features are more suitable for northern. The materials at hand wherewith to build have a strong influence in forming the style of Architecture of a country, and it is noteworthy that in every age and to every people stone seems to be the material which most commends itself for suitability, appearance, and permanence. Where the stone is soft, like Parisian limestone, we find ornamentation carried to a great extent, and where hard, like the Egyptian or Aberdeen granite, we find mouldings few and simple, carving rare, and the beauty of the material itself relied upon for effect. Where good clay abounds and stone is scarce, we find bricks used, and where neither is readily available a construction of timber and plaster or mud takes the place, as in some of the counties of England, but in such districts the finest buildings are generally built of stone transported at considerable cost from a distance, neither the brick nor the timber and plaster having that permanence and substantiality which we look for in a fine specimen of Architecture. The pursuits and habits of the people have necessarily a great influence in forming their architectural style. Agricultural and trading people, such as the Egyptians, Phœnicians, Greeks, Venetians, and the like, have generally excelled in Architecture, and the palaces of their merchant princes serve us at this day as models for our finest buildings. Some constructed their buildings for internal effect chiefly, such as the Egyptians and Mohammedans, others for external, like the Greeks; while the Roman and Gothic builder aimed at combining the two ideas. While as a rule war is destructive of any advance in Architecture, it is different when a highly-civilised people push their conquests over barbarous countries. The Romans, when they subdued the greater part of Europe, carried their Architecture with them, and it breathes out its influence to this day. A similar process is at work in India, where British architects are erecting buildings to British ideas, and at the same time suitable to the climate and materials at hand. Commerce has been a great factor in promoting Architecture, for commerce can only flourish where life and property are reasonably safe, and Architecture requires similar conditions. In tracing back the course of architectural history chronologically, we do not find an unbroken sequence carrying us back to a time when the whole world was in a state of barbarism, for, after getting beyond all written history, we come to the early Architecture of Egypt, complete in its design and execution when all other countries are quite uncivilised. We find no evidence of the growth of the Art in Egypt. There we find those specimens of Architecture which are unquestionably the oldest buildings in the world, and though entitled to this distinction, strange to say they are the buildings which most excite our surprise and admiration, even at the present day, as well for their scientific construction and the excellence of their workmanship as for the wonderful size of the everlasting Pyramids.

MODERN INFLUENCES ON STYLE.

We may now consider some of the influences at work in modern days, tending to modify the style of our Architecture, and under which a new style may ultimately be evolved in course of generations. One of the most potent of those influences in the modification of design, and therefore ultimately of style, in Architecture, is the invention of new materials and the use of already existing materials in methods and to extents undreamt of before. For instance, iron has made possible constructions which before would not have been thought of. The Crystal Palace was an adaptation of it which excited wonder and admiration at the time, and in the buildings of the last Paris Exhibition it was used in a most suitable and artistic manner. Roofs and domes can be constructed of it, at the same time strong and light, and so as not to exert lateral thrust on the walls, thereby doing away with the necessity of thick walls or

* A paper recently read before the Edinburgh Architectural Association.

buttresses. Floors can be made of great span, and unobstructed by piers or columns. Columns can be made strong, and yet so slender as to be unobtrusive where massive stone or brick piers would be highly objectionable. The many-storied buildings which the Americans are raising in their large cities are in reality iron structures cased with stone. Portland cement is another material which is having a distinct influence on Architecture. Indeed, so indispensable has this material become that we may well wonder how builders got on before its invention. By its means a building may be constructed without a hewn stone in any part of it, and it enters largely into the construction of most buildings, either in concrete foundations, fireproof floors, or otherwise. The advantage to be derived from artificial material is most apparent where there is considerable repetition of some ornament or feature, and a certain danger to good design lies in this very facility. But it is in vain that the ultra artistic soul inveighs against the use of such mechanically produced ornament, and condemns it as inartistic. The public generally will not pay for that subtle difference of artistic effect which is to be found between hand and machine work, and, except for positions where close inspection is possible, the extra cost is thrown away. By means of such mechanically produced moulded work or ornament, a design may be realised which the cost of hand labour would make quite prohibitory, and I hope, in the interests of practical common sense, that the number of those is few who would say that rather than use such aids it would be better to leave a building in archaic simplicity. Think you that the ancients, for whom those of this cast of mind have so much reverence, would have adopted this course? Had they had Portland cement what would they not have done with it, especially if combined with iron? Instead of wooden roofs, vaults which they feared to throw over cathedral naves would have floated over nave and choir and aisle alike; the ponderous piers they found necessary (and sometimes they did not make them strong enough) to carry the enormous weights would have been reduced in size, and their great creations, whether in massive tower and soaring steeple, in flying buttress, slender pinnacle or tracery almost too delicate for the rough winds of heaven to blow upon, would have had a strength and permanency which would have preserved them as a joy to many generations. Truly we are not half grateful for our advantages. In ancient days the inventor of Portland cement would have been canonised as a saint, and builders would have burned candles on his altar for ever afterwards. Amongst other materials tending to modify design, I may mention terra-cotta, tile faience, mosaic and asphalt.

MATERIALS AND METHODS OF CONSTRUCTION.

Such new materials and methods of construction have, as every architect knows, a very great deal to overcome in the way of rule-of-thumb practice, vested interests, and prejudice before their adoption becomes general. Often, to begin with, it is only by imitating the old method of doing a thing that a beginning can be got, while a better way may be latent in the nature of the material. The capitalist is naturally a very cautious individual, and he will not spend his money except for that which he is quite sure is bread. He prefers that some one else should experiment with new methods and materials, and then he will enter into their labours. Again, there is scarcely an architect who has not had reason to rue the day he was induced to go into some departure from the usual. His experience of this is that all who have to do with the innovation look askance at it. The workmen are unfamiliar with and often unfriendly to it. Those who may have to work it will not take the trouble to understand it, and put the blame on the new material or method, which rightly belongs to themselves. The client thinks that he would have been better with the old way, and that the architect is to blame in recommending a thing without knowing it to be perfect. Sometimes the thing or method is not just free of all imperfection any more than most things

and people are in this troublesome world, and under the combination of all such influences the unfortunate architect inwardly vows that never again will he advise the adoption of any new-fangled thing or method. Some may be inclined to blame an architect for following precedent too much in his practice, but it would only be fair to remember that he is not a free agent in this matter. He is not spending his own money, and he is not entitled to spend his client's in experimenting, unless with express permission and in view of some very substantial probable gain. In dealing with a new material he may think he sees some more excellent way of using it, but it is only by experience that this is to be proved, and experience is often a very costly—as well as very efficient—teacher. Doubtless there are latent possibilities in many new materials, and many departures from old forms of design and construction might be made, but the public are slow to follow up and adopt such new ideas. They must be made gradually familiar with them. Precedent is the all-powerful factor with most in forming ideas on Architecture. What they have seen, that they can understand and that they want. They are thoroughly convinced of the truth of the maxim that "seeing is believing," and, unfortunately for the architect and the advance of his Profession, they will not take place among the more blessed few who, having not seen, yet have belief in the skill of the architect to fulfil their requirements in the best way.

NATURAL TREATMENT OF MATERIAL.

I lately observed an important building being put up in the classic style where, over shop windows, cast-iron lintels were being used, having mouldings on them in continuation of those on the stone piers. This is an instance of the architect selecting the most suitable material for his purpose, but one which was not available to those who perfected this style of Architecture. By its adoption, the piers can be further apart than would be possible with a stone construction, and herein lies an important departure from one of the leading characteristics of the style. But is it justifiable to make this new material imitate stone, which would be practically an impossible material to use for the span required? Yet what architect would not do it, and would dare to adopt a treatment peculiar to the nature of the material? It would be an incongruity in the design, which is classic in feeling and demands a straight stone-like lintel. Truly when we come to close quarters with questions of this kind, our general theories often have to stand aside; but nevertheless it is highly desirable to keep the general principle in mind that every material has its own natural treatment, and it is well to use it in that way so far as prejudice or use and want will allow. Modern inventions, in which our age is so prolific, are having a distinct moulding influence on Architecture. Railways have brought out a phase of Architecture peculiar to themselves in their great stations with roofs of immense span. Our postal service has been the means of many handsome buildings being erected all over the country. Lifts, telephones, the electric light, and pneumatic tubes have all been utilised in business centres, and affect the design of city buildings. By the use of lifts many-storied buildings become as convenient as those of two or three floors, an idea which the Americans have carried to excess; while the electric light enables basements, which before were almost useless, to become valuable adjuncts to such buildings as hotels and large warehouses. Telephones and pneumatic tubes enable distant buildings to become almost as convenient as central ones for business purposes. The habits of modern life have, of course, a strong influence on our Architecture. The facilities for travel are such now that the prophecy of Daniel seems to be fulfilled, that "Many shall run to and fro, and knowledge shall be increased." By travel and photography people have become familiar with the Architecture of all countries, and can select what features of each seem to them most pleasing and suitable for their purpose.

(To be continued.)

KEYSTONES.

The foundation-stone has been laid of the new church which is being erected on the old site, Rye Hill, Newcastle.

TENDERS for the erection of the new meat market in Leeds are to be invited. The site of the new structure has been marked out, and workmen are now engaged preparing the foundations.

THE studio of the late Sir John Millais, P.R.A., 2a, Palace Gate, Kensington, has been taken by Mr. H. J. Thaddeus, R.H.A., who is at present engaged on a portrait of his Royal Highness the Duke of Cambridge.

RAPID progress is being made with the two principal improvements which will be especially noticeable at St. Stephen's when Parliament reassembles—the new ladies' doorway on to the terrace and the portico over the entrance to the Speaker's official residence.

THE will of Sir John Gilbert, R.A., the famous painter, of Ivy House, Blackheath, who died on October 5th, is proved by his brothers, Messrs. George and Frederick Gilbert, by whom the testator's personality is sworn at £231,928 6s. 9d. gross, and £231,584 2s. 8d. net.

THE Halifax Town Council has resolved to apply to Parliament for a bill empowering them to construct new waterworks at Walshaw Dean, to lay down and work electric tramways through twelve districts, to widen several streets, and to manufacture carburetted water gas, &c.

THE London County Council has addressed a circular letter to the vestries and district boards of works of London suggesting that fire-alarm indicators be placed on the public lamps, and asking the local authorities whether they will undertake to provide and fix the same in the different districts under their control.

A TABLET and medallion to the memory of the late Rev. Dr. Robert Macdonald has been unveiled in the North Leith Free Church. The sunk portion of the tablet is of pure white marble, while the outer portion or bordering is of Sicilian marble. The style of the tablet is Early English Gothic.

THE "Bun Shop" in the Strand has been offered for sale, but as only £9000 was bid it was bought in, the reserve price being £12,500. A short time ago, a drinking bar, not more than 20yds. long and 4yds. wide, in the same locality, was offered for sale. As "only" £30,000 was bid the place was bought in. The owners wanted £75,000.

MR. E. J. HUGHES, the town surveyor of Newhaven, was badly burnt about the hands and face by an explosion of sewer gas. It seems he was attending to the opening of a manhole in Bridge Street, and dropped a lighted match down, at the same time warning others to stand back. An explosion occurred, and Mr. Hughes does not appear to have given himself time to get away.

THE position of engineer to the Liverpool Corporation, vacated by the retirement of Mr. Boulnois, is one of the prizes in an important profession. January 18th has been fixed as the final date for sending in applications for the appointment. A commencing salary of £1000 per annum is offered, and preference will be given to candidates between 30 and 45 years of age.

THE Dean of Gloucester has just made a very beautiful gift to the cathedral in the form of a magnificent festal altar cloth. The design, an elaborate Italian piece of work (early seventeenth century—roughly of the last days of Elizabeth), is on white figured satin brocade, and is composed of flowers and foliage richly embroidered in delicate shades of colour and encircled with gold.

THE new superstructure of Moorgate Street Station, designed by Mr. Delissa Joseph, F.R.I.B.A., has now been completed, at a cost of about £18,000, the contractors being Messrs. J. Allen and Sons. The elevation, which is Classic in design, is executed in Portland stone, and occupies a frontage of about 155ft. to Moorfields, and of about 90ft. to Fore Street Avenue. The new buildings take the place of the wooden structures which so long disfigured this important site.

Professional Items.

BARRY.—A new public abattoir has been erected at Barry. The buildings are constructed of red brick, with dressings of buff brick and terra-cotta, and roofed with blue slate, with red ridge tiles. The slaughter-halls and cooling-rooms have a dado 4ft. to 5ft. high of white brick glazed, and are fitted with hoisting machinery, and the adjacent roadways are laid in *Vál de Travers* asphalt, on a bed of cement concrete 6in. thick. The lairs for sheep and calves have a dado of salt-glazed bricks, and are fitted with wrought-iron railings and gates. The lairs for cattle have a salt-glazed brick dado, and have bars secured to the wall. The drains are all connected to the main sewer, and the site comprises an area of 2r. 11p. The cost of the buildings will be about £6500. They are carried out from designs prepared by Mr. J. C. Pardoe, surveyor to the Council. The contractor for the buildings is Mr. George Rutter, Barry, and for the ironwork Messrs. W. A. Baker and Co., ironfounders, Newport, Mon.

BLACKBURN.—A scheme is on foot for the enlargement of the Blackburn Post Office. The present proposal is to enlarge the existing premises, which are owned by the Crown, by acquiring the shop premises adjoining, and extending the frontage round the corner into King William Street. The difficulty of obtaining a more suitable site would be considerable, and the improvement at that particular corner, by the demolition of the existing buildings, would be so great that it is hoped the scheme may be successfully carried out.

BRADFORD.—Extensive building operations are in progress at Bradford. The clearing away of hundreds of workpeople's dwellings in the centre of the city—partly for sanitary reasons and partly on account of railway and other operations—has necessitated the erection of improved houses of a similar class outside. At the present time a portion of the Horton Grange estate at Legrams is being parcelled out. The estate in its entirety embraced about 100 acres of land. It is now proposed to construct a road, 18yds. in width, up the Horton Beck valley, from Horton Grange Road to Beckside Road, a distance of 700yds., and at a gradient varying from 1 in 24 to 1 in 30. Sufficient evidence of the progress made is furnished in the fact that since 1832, when twenty-nine acres of the Tanhouse estate were sold to Messrs. Johnson and Jones, that firm has erected 500 houses. Moreover, 170 dwellings are in course of erection by Mr. Johnson and Messrs. N. and D. Thompson. On the west side of Grange Road, Mr. Johnson has about 250 more houses in hand. On the Lidget Green and Beckside portions of the Horton Grange estate some twenty-nine acres have been disposed of to Messrs. Robinson and Gaunt. This land is to be laid out in streets and building plots.

BRISTOL.—The new mission-room of Temple, or Holy Cross, Church has been formally opened. The building has been erected at a cost of about £3000. It is situated on a site belonging to the vestry overlooking the churchyard. It comprises a handsome hall to accommodate about 300 people, with a retiring-room attached, and two large class-rooms. There is also a residence for the caretaker. The building is in the Gothic style, and is entirely of brick, being faced with brick inside, and the traceried windows are filled in with ornamental glass.

CARDIFF.—The restoration of the tower of St. John's Church has been completed. In A.D. 1473—over four centuries ago—the foundation of this fine tower was laid. It was designed by one Hart, an architect, who also designed the towers of Wrexham and St. Stephen's, Bristol. The embattled parapet, with its graceful pinnacles, is a landmark of ancient Cardiff. The south-west angle turret was struck by lightning in 1860, and was rebuilt by Mr. Shepton. The windows are full

of rich and well-thought-out tracery work and ornament. Before the restoration the tower was in a very bad condition, the top portion being dangerous. The work of restoration included the taking down of about half of the embattled parapets and rebuilding; also taking down of about 25ft. from the top of the north-west and south-west buttresses, which had broken away from the walls entirely. While these buttresses were being rebuilt the lofty angle pinnacles were held up by chains from the opposite angles. The windows were all restored where found, perished, and the whole of the tower from top to bottom was pointed down, the walling made good, a new lead flat laid, and copper stays fixed in place of iron. The floors over the entrance and under the ringing floor are groined in stone on the old corbels, which were built in when the tower was erected. The tower floor was carried down to the original level inside and out, and an area formed in the street, enclosed with a wrought-iron railing, to show the original level, so that the congregation will now walk on the original threshold which the inhabitants of Cardiff walked on over four centuries back. The walls which blocked up the north and south archways have been removed, the arches restored, and the carving which was hacked off restored, and the gates hung inside. The work has been carried out by Mr. George Shepton, under the superintendence of Mr. C. B. Fowler, of Cardiff. The glass has been supplied by Savell and Co., of London, the wrought iron gates and railing by Messrs. Leatheren, of Cheltenham.

An addition to the number of arcades in Cardiff has been made recently in "The Central Arcade," which runs through from St. Mary Street (not far from the station end) to the Hayes. The style of Architecture adopted is Flemish Renaissance. At the entrance stand a pair of large and well-lighted shops, and within the arcade there are no less than twenty-nine shops on the ground floor. The windows (plate-glass) are set in neat mahogany frames of the latest style. Each shop is provided with upper rooms for storage or show-room purposes, and a set of offices in the basement. A central conduit, running the whole length of the arcade in the basement, forms a novel feature of the building. Through it run the gas and water pipes, and also the electric wires; a couple of ventilating fans (each driven by an electric motor) draw fresh air from the St. Mary Street end, and eject it through a large brick ventilating shaft that terminates in an exhaust ventilator. From this conduit all the drains may be repaired without disturbing the shops, and all foul air is taken off from the offices by the fans. The general construction of the arcade is in local stock brick, carried on iron and steel columns and girders. Mr. Edwin Seward is the architect, and Messrs. E. Turner and Sons the builders.

DUBLIN.—The new altar of Mary Immaculate in the Pro-Cathedral is a beautiful specimen of artistic workmanship in the Classic style, to harmonise with that of the Pro-Cathedral. The reredos, tabernacle, and dome over are executed in statuary marble, the tabernacle being enriched with fluted Sienna marble columns, worked to the true Entasis, and having moulded caps and bases. The cornice over these is moulded with carved cresting on top, and surmounted with a proportioned dome, enriched with moulded ribs, and crowned with a foliated cross. On either side of the tabernacle is the reredos divided into panels, with semi-circular moulded heads forming an arcade, and having moulded pilasters and columns between in Sienna marble. The most striking portion of the work is the mosaic treatment of the background of the niche and the part surrounding it, all of which are executed in glass mosaic, the background of the niche being in blue, with gold stars, while that surrounding it has a gold ground with a wreath or scroll of lilies exquisitely inlaid in different shades of colour, and all outlined in black. The altar rail is executed in pure statuary marble throughout, with columns in Sienna marble, with moulded caps and bases, the cornice on top being richly

moulded. The whole of the work has been carried out from the designs of Mr. G. C. Ashlin, architect.

GLASGOW.—The arrangements for the reconstruction of the Royal Infirmary are being gradually matured. The plan which it is expected will be adopted proceeds on the idea that the new infirmary shall be constructed on the pavilion principle. The several blocks will run from east to west on the site; and be connected from north to south by a covered way. For the kitchens, engine-house, &c., accommodation will be found at the eastern boundary, which is on a lower level than the portion of the site towards Castle Street; and on this portion of the ground space will also be found for an additional ward for special cases.

GOVAN.—The foundation stone of St. Kenneth Church has been laid. Mr. Macgregor-Chalmers is the architect for the new edifice, which is the third that has been erected as part of the large scheme of church extension for the parish of Govan. There will be accommodation for 800 people, and the hall will accommodate 300. There is also a small hall, committee room, vestry, &c. The church comprises a large nave, with one side aisle, in which is the only gallery, a large chancel for the choir and communion table, a side chapel, and an organ chamber. The walls of the halls, &c., will be finished in pressed red brick. The contractors are: Mr. W. Calderwood, mason; Mr. John Smeaton, joiner; Messrs. M'Ouat and Sons, slaters; Mr. Norman M'Dougall, glazier.

INVERNESS.—The Crown Free Church Hall, Inverness, has been opened. At present only part of the full plan has been proceeded with; when ultimately completed, the building will give accommodation for between 800 and 900 people. Mr. James Rhind is the architect. The church and hall are in the thirteenth century Gothic style, and is eminently suited for the fine situation and architectural institutions with which it is bounded. The elevation to Kingsmill Road shows three large doors and a large rose window about 18ft. in diameter. In the church the seats will be semi-circular, with a slope towards the centre; while in the hall accommodation has been provided for about 400 persons.

LIVERPOOL.—The new Lyric Theatre, recently opened, stands on a site situated at the corner of Everton Valley and Kirkdale Road, and has been erected by Mr. Ellis Brammall. The front part of the house is in Everton Valley, and has a red brick facing. Inside the decorations are most effective. The total number the building will hold is estimated at close upon 2000. The interior decorations have been carried out in fibrous plaster in the Arabic style, and the ceiling in particular bears evidence of the graceful and dexterous touch of the consummate Art of the decorator. Special attention has been paid to the modes of ingress and egress to and from the auditorium. The theatre is lighted throughout by electricity, and there is an auxiliary supply of gas. The architects are Messrs. J. and G. Chappel, of Walton; the fibrous decorations have been carried out by Messrs. W. Goodall, of Hope Street; the painting, decorating, and furnishing by Morton's, of Bold Street; the electric fittings by Messrs. Williams and Bucknell; the gas and limelight arrangements by Messrs. Ayres and Tuplin. The whole of the work was carried out from the designs and under the personal direction of Mr. W. Vaughan, of 11, Westminster Chambers, Liverpool.

LONG PRESTON.—The new building of the Long Preston Endowed School has been opened. Mr. C. R. Chorley, of the firm of Chorley, Cannon, and Chorley, architects, Leeds, prepared the plans, with accommodation for boys, girls, and infants. The schools are built on the central hall system, and will accommodate 152 boys and girls, 64 infants, and 41 babies. The central hall, which is lighted at the top and ends, is 53ft. long by 24ft. wide, and will also be used for parochial

gatherings. Around the hall are the classrooms, cookery class-room, infants' school, and babies' room. The building is of a simple but substantial character, the walls being of Bradford stone, and the internal woodwork of pitch pine. The total cost has been £3300. The following were the contractors: Masonry and carpentry, James Russell; plumbers' work and painting, Thomas Throup; slating and plastering, William Jackman, all of Long Preston; and ironfounders' work, Teale and Somers, Leeds.

LOUGHREA.—Considerable progress has been made in the work of erecting in Loughrea the imposing new cathedral. The clearing of the site involved the total demolition of Monahan's Hotel. The situation of the new edifice is considered most suitable, and the name of the building will be the Cathedral of St. Brendan of the Lake. The total length of the nave inside the walls will be 120ft., and the width across the transepts 90ft. The sanctuary will be 30ft. by 28ft., and the side chapels 15ft. by 15ft. The cost of the structure is roughly estimated at £20,000. The style of Architecture will be the Early English Gothic, and the plans provide for nave, sanctuary with apsidal end, aisles, transepts, baptistery, two sacristies, tower, and spire. The nave will be divided from the aisles, transepts, and side chapels by richly-moulded arches, supported by polished pillars of red Aberdeen granite. Light will be provided through large tracery windows in the apex and in the gables of the transepts, and richly-moulded tracery windows in the clerestory. The church will be built of limestone, a very fine quality of which is locally available. Mr. W. H. Byrne, C.E., and Mr. Glynn, both of Dublin, are carrying out the work, the former being the architect, and the latter the contractor.

MELLOR.—St. Mary's Church, Mellor, has been reopened after having been renovated. The cost of the restoration is estimated at £3500. The roof and coping stones have been thoroughly examined and repaired. The Dodgson monument has been placed inside the church, and a suitable substitute erected over the family vault; and the Hargreaves, Dodgson, and Troy windows have been protected with sheet glass. The main entrance to the church has been much improved. An organ has been built by Mr. Edwin Smith, of Blackburn. A new font, with light oak cover, has been given, and is a copy of a thirteenth or fourteenth century font, which was discovered buried beneath one of the porches of the old church at Welshpool, Montgomeryshire. Mr. Varley, of Blackburn, carved the font, and Mr. Harry Hems, of Exeter, the cover. The chancel screen is of light oak. The sacred edifice has, of course, been beautified, and the work has been executed by Messrs. Paley and Austin, architects, Lancaster, and Messrs. J. Hatch and Sons, contractors, Lancaster.

MORECAMBE.—It is proposed to erect a revolving tower at Morecambe similar to that at Great Yarmouth. The site of the tower is the open space between Highfield and West End Road, with a frontage to the promenade. The height will be about 160ft. and the width 15ft., and it will be surrounded by a revolving platform, circular in shape, to accommodate about 150 persons.

NEATH.—Another old landmark has been swept away in the shape of the old Academy Buildings in Green Street, and on this site has been built a block of buildings which forms another architectural improvement designed by Messrs. Wilson and Moxham, architects, Swansea. The exterior is of red St. Bee's stone and guting stone, built in alternate course, carried up four stories in height, and terminating with a sharp pitched gable, surmounted by a huge carved griffin. The contractors for the work were Gustavus Bros., of Swansea.

NEWTON ABBOT.—A new Workhouse Infirmary has been erected at Newton Abbot. The building comprises a central block, in which are twelve rooms, 17ft. by 14ft., nurses' duty

rooms, &c., and two wings with two wards in each, 62ft. long by 24ft. wide. All are 11ft. high. At the rear, connected by covered ways, is another building, including three lying-in wards and five bedrooms for the nurses. Two of the lying-in wards are 22ft. by 20ft., and the other 15ft. square. The exterior walls are of local dressed limestone, with white brick dressings, and the interior walls are of brick, a cavity being left between the two to render the walls damp-proof. Twelve of Boyle's fresh-air inlets have been erected in each of the wards. The heating arrangements are very efficient. All four of the large wards are heated by means of Shorland's Manchester stoves, of which there are two in each ward. They take in a current of fresh air from the north wall under the floors, warm the air, and then distribute it in the rooms, making them perfectly warm and comfortable, and rendering the temperature the same all over the wards. Fireplaces are provided in the other wards. Corridors, bathrooms, staircases, and every other part of the building are heated by steam from the six-horse-power boiler in the cellar, which boiler also supplies the whole building with hot water. All the corridor floors and ceilings, as well as the walls and ceilings of the staircases, are of fireproof concrete, and the whole of the corridors, lobbies, and offices are lined with glazed bricks to a height of 4ft. 6in. On the ground floor there is a surgery; the nurses' duty rooms are well fitted up, and four large heated linen closets are provided. Mr. S. Segar is the architect; the building has been erected by Mr. F. A. Stacey; and Mr. J. Cole, of Torquay, was the clerk of the works.

SCAWTON.—The church of St. Mary's, Scawton, near Thirsk, has recently undergone restoration. The weight of accumulated years and the storms of centuries had long since made visible the decay of this Early Norman structure—which was beyond dispute the oldest unrestored church in Yorkshire. At the time the present work was undertaken it was unfit for worship, with its decayed roof, its cracked walls, and tottering porch; while its wooden bell-cot, which rose a yard above the roof, had some time ago become so unsafe that it had to be removed. The porch has been entirely rebuilt, also part of the west end, and the original window restored. The outer walls have been carefully repaired where required, and the whole completely repointed. The roofs have been renewed, the heavy stone slates replaced by red tiles, the chancel roof brought to its original pitch, a new bell-cot provided, all dressed stonework stripped of its plaster and whitewash, floors replaced with cement concrete, &c., and the church now has a neat appearance.

SHEFFIELD.—The Alhambra Theatre of Varieties, on the main road at Attercliffe, has been opened. The distinguished feature of the Alhambra is its construction. Its seating accommodation, which is for 1600 persons, will give the audience an uninterrupted view of the stage. The architects for the building are Messrs. G. D. Martin and A. Blomfield Jackson. On the exterior, a good elevation is provided in glazed brick and terra-cotta faience for the base, red-brick for the staircase bowers, terminating in cupolas and flagstaffs, which flank the frontage on either hand, and stucco ornamented with carved heads, for the remainder of the façade. Inside, the accommodation comprises, on the ground floor orchestra stalls, stalls and pit, and upstairs a large circle or balcony, holding not far short of as many as the whole on the ground floor. The decoration, in consonance with the title of the building, is of Moorish type, and is of bold and effective design and artistic colouring. The scheme includes both walls, ceiling, and proscenium, and the most striking feature is certainly the proscenium, which, instead of being the usual square opening, has the form of a beautiful curve, capable of most graceful treatment with the curtain. The upholstery is uniformly of crimson, plush on moveable chairs being used for the orchestra stalls and a comfortable material for the stalls and balcony. The building is guaranteed fireproof

throughout; even the balcony, which is on cantilevers, having a flooring of concrete. Messrs. J. T. Rickett and Company have carried out the electrical work, and the Sheffield Gas Company has fitted up the system of gas lighting. The building itself has been erected by Messrs. G. Longden and Sons, of Neepsend Lane, Sheffield; the decorations, seatings, and upholstery being carried out by Messrs. A. R. Dean, of Birmingham.

TREDEGAR.—A new chapel has been erected at Walter Street, Tredegar. It supersedes a corrugated iron building, provides accommodation for about 400, and has a very convenient schoolroom at the rear. The plans were prepared by Mr. W. S. Williams, architect, Tredegar. The builders were Messrs. Edwards Brothers, Tredegar.

WIGAN.—The marble restoration of the high altar of St. John's was recently brought to a satisfactory completion. Though the name of the original designer of the altar is lost in obscurity, the work is certainly a very beautiful specimen of a Greek temple, in the Renaissance style. It was never proposed to change a line or moulding of the old altar, but it was generally admitted that the plaster used in its construction was anything but worthy of the design. The re-painting and re-gilding of this poor material would soon yield to the ravages of the Wigan atmosphere, so it was thought better to restore the altar in marble veneer. Solid blocks were out of the question, as they would involve an immense outlay, and the demolition of the existing structure. It was feared that as this was the first experiment of the kind in altar-building, it would be difficult to make the Scagliola marble wrap round the eight exquisitely moulded pillars that support the great dome and lantern, but this difficulty was overcome by the contractors, Messrs. Hammond and Son, Quay Street, Manchester. This firm, after stripping the lantern and pillars, encircled them with white marble, and clothed the convex side of the dome with the same material in dark green. To relieve the great mass of stone, the services of Mr. Louis Dandy, a Liverpool artist, were called in, and the gold he has employed on the capitals and balustrades and along the marble frieze has added immensely to the gracefulness and impressiveness of the whole erection. After much consultation it was decided that the central truncated tower, which supports the upper story and contains the tabernacle, should be done in "Devonshire rouge." This choice not only gives stability to the base, but enhances the effect of the white and gold, and throws the outline into bolder relief, and while it adds to the general effect of loftiness, removes all appearance of topheaviness. In the central panel of this main shaft is inserted a very handsomely wrought brass tabernacle, supplied by Messrs. Hardman, of Birmingham. The panels of the table proper are in dark rose-red, known as Rosso antico, lightened by a large central space of gold, with an elaborate design in branches, leaves, and tendrils. The six magnificent candlesticks, in carved wood, have been re-gilt, a new sanctuary carpet has been laid down, and no minor detail that helps to the impressiveness of the design has been overlooked.

The old music hall in Cheapside, Wolverhampton, has been demolished, a company having been formed to erect a new Empire Music Hall on the site which on one side opens into Queen Square. In getting out the foundations, several interesting discoveries have been made. Two wells, one forty-four yards deep and the other forty yards deep, have been unearthed. These are being filled up. There has also been found a subterranean passage, which has been traversed for a distance of 30ft. in the direction of Queen Square, where it was found blocked up by a wall. It is supposed that the underground walk, which is hewn out of solid rock, was constructed some hundreds of years ago to enable people to pass from St. Peter's Church, when it formed part of the monastery, to some other building in the vicinity.

Enquiry Department.

We have pleasure in announcing that the services of specialists in every branch of the building industry, or representative of every phase of architectural thought, have been secured in connection with our "Enquiry Department." We shall at all times be pleased, therefore, to receive queries from correspondents, and lay them before the specialists concerned, who, in their turn, will be pleased to give the fullest and most accurate information.

COLOUR DECORATIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you kindly inform us the publishers' name and the price of the book, "The Principles of Harmony and Contrast of Colours," by M. Chevreul, quoted by Mr. L. A. Shuffrey in his recent paper before the A.S.A.?—Yours faithfully, J. LONG & SONS.

Mr. Shuffrey's recommendation of M. Chevreul's work has already been called in question in more than one quarter. The book in question was published so long ago as 1854, when the study of colour was in its infancy, and it is clear, therefore, that considerable modification and revision is necessary to make it an authority at the present time. You would be better advised to select one of the following books, which are both recent and admirable works:—"Colour; a Manual for Students," by Prof. Church (new and enlarged edition) 1897, 3s. 6d.; Cassell & Co., La Belle Sauvage Yard, Ludgate Hill, E.C. "Painting and Decorating," by Walter J. Pearce, 1898, 12s. 6d.; Griffin & Co., Ltd., 12, Exeter Street, Strand, W.C.

DUST-SHOOTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you please give me information as to how a dust-shoot, for a small infirmary with four beds, is constructed? The dust-shoot to be from first floor. I hear they are much used abroad.—I am, Sir, your obedient servant, A. E. SIDFORD.

The usual form of dust-shoot is quite a simple contrivance, being but a galvanised iron pipe of 9in. or 12in. diam., with shoe to discharge over a "sanitary" dustbin, and with closed hopper head at top, into which the dust is shot through an opening in the wall on upper floor, which closes with a hinged iron flap, hung at the top, and acting in a similar manner to a flap-trap in a drain. A pipe should be taken from the upper part of hopper straight up above eaves, as a ventilator, and treated as would be that of a soil-pipe; for a dust-shoot, however well kept (and it should be brushed through at regular intervals), is sure to collect impurities, and on that account is not to be recommended if there be other ready means for removal of the refuse.

THE new Public Hall at Brynamman is a commodious iron building, will seat about 800 people, and the cost when completed will be about £800.

OLD Polworth Church, in Berwickshire, is about to be enriched by a handsome burial tablet to the memory of the poet Calder, who was born in the neighbourhood. The tablet has been provided by the London Borderers' Association.

THE Corporate Property Committee of the Leeds County Council has decided that all the unsold land on the east side of Victoria Avenue, Ivy House Estate, containing an area of 40,629 square yards, be sold to the Sanitary Committee for the purpose of the erection thereon of dwellings for the accommodation of persons displaced by insanitary area schemes, at the price of 1s. 9d. per square yard, and that none of the unsold land on the west side of Victoria Avenue, containing 12,672 square yards, be disposed of without first giving the Sanitary Committee the option of purchasing such land.

Correspondence.

A YEAR'S BUILDING OPERATIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In reading the Journal of this week, I find a very serious mistake occurs under the heading, "A Year's Building Operations." In dealing with Leeds, your correspondent cannot have been acquainted with the facts connected with the dispute to which he refers. A strike took place in a certain firm owing to the bricklayers constantly fixing stone. I have no intention of entering into the merits or demerits of the question here, but where your correspondent got his information from, in saying that the Union had imposed a fine of £15, I am at a loss to understand. A deputation of the masters and men met to discuss the matter in dispute but the question of the said firm paying £15—or any part of it—was never mentioned, as the deputation of the men had no authority to make any such claim. Hoping you will make this correction, and thanking you in anticipation—I remain, Yours faithfully,

"ONE OF THE DEPUTATION."

SKIPTON COTTAGE HOSPITAL COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—If all the facts are true as stated by your correspondent "Verbatim et Literatim," there seems to have been some underhanded work going on in the above competition.

If a perspective view was sent by any competitor, when the conditions stated that none would be allowed, he would run a great risk of being excluded from the competition, and at the same time he would be acting unfairly towards his brother architects.

It seems a serious charge to bring against a successful competitor, to state that he submitted amended plans before the award was finally given. What proof has "Verbatim et Literatim" that this was so. I should like to have further particulars?

I was one of the unsuccessful competitors, and I do like to be beaten in a fair field when beaten at all.

If the hospital committee behaved as your correspondent suggests, what guarantee have the competitors that the "eminent firm of architects" who are said to have judged the merits of the plans existed, except in their imagination.

"Verbatim et Literatim" has evidently seen the plans. Can he enlighten us whose plans were the best, putting his own plans out of the competition?—Yours, &c.,

"THE CAPTAIN."

"A DEPRESSING SERIES."

SIR,—I write to you in the dim hope that something may be done at this cheerful season of the year to remove a growing incubus from all who are interested in Architecture.

In the pages of one of your contemporaries, Sir, painful disclosures have weekly been divulged under the title of "Architecture in our provincial towns"; and I appeal to you and to all who are interested in the cause of true Architecture, is it seemly—is it decent, even—that these things should be dragged into the light of day?

It is true the author of this depressing series may have some moral end in view—some deep irony may lurk in his commendations. Behold!—we may imagine him declaim—behold the Architecture of the nineteenth century! See it here in all its smoke-grimed horror. Catch the full flavour of all its sordid commercialism, and learn to do better.

Learn from the nearest hoarding how to use bright colour that shall cheer the soul of the passer-by, and fling away all the useless lumber of traditional forms—at any rate, till you can use them to better purpose than this.

But such a lesson, if such is intended, has been sufficiently enforced—we can bear no more. The particular horrors of our own particular provincial town we have become inured to by long and daily association. Here

may be found the bank (dirtily-magnificent), the perky Wesleyan chapel, designed by Messrs. — and — (who are not influential members of the congregation for nothing), the church in the Gothic style, with tower, complete—in fact, all the material for one of the series we allude to, but not for worlds will we disclose the name or situation of this particular provincial town.

It is almost impossible for one who has artistic perceptions to imagine the state of mind which can seriously consider some of these buildings as works of Architecture, and solemnly reproduce them as such.

If they are so, let us never handle pencil again. But one is reminded of some quaint old town still remaining where true Architecture may yet be seen, full of vitality and charm. In every village old churches and houses still bear witness to the true and the beautiful in Architecture, while both in town and country may here and there be found the rare example of our modern Art—work which bears the mark, to those who can read between the lines, of the not altogether unsuccessful struggle of the artist with adverse conditions.

S.

THE INSTITUTE EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—A letter appeared in your columns of December 22nd signed by Mr. Ernest R. Danford, in which the astounding statement is made that the Institute does not profess to examine in Art, but only in those branches of Architecture which it is essential for an architect to know. Are we to infer from this that Art is not essential to an architect? Or merely that when the Institute pretends to examine in Art it is exceeding its duties. If this latter, it is well to know it, once for all. Of course, I presume Mr. Danford knows what he is writing about.

If it is an admitted fact that the Institute does not examine in the Art of Architecture, then those who object to the Institute examinations on the ground that by such means you cannot advance the Art of Architecture, but only retard it, have a distinct ground of difference, and can conscientiously hold aloof from the Institute.

But the fact of a man being able to put the letters R.I.B.A. after his name, conveys a wrong impression to the public. They imagine when they see an architect's plate with such letters after his name that he is, in every sense of the word, fully qualified.

How totally misleading this is, all true lovers of the real Art of Architecture know only too well. There are heaps of such men, with these letters after their name, practising in the provinces, who are daily erecting buildings which have not the slightest claim to the title of Architecture, and only excite the derision of those who know the true meaning of the word Art as applied to Architecture.

Unfortunately some of the public have sufficient knowledge of Architecture to know what it means, and are able to recognise and appreciate such when they see it. And the fact of such men practising as architects, and having the letters R.I.B.A. after their name, makes them have a very poor opinion of the Institute.

If such men were content to add after their names "Architect by Examination," or merely "Registered Architect," there would be little harm done. But to imply to the general public that they are, in every sense of the word, architects, and therefore thoroughly understand their Art, and at the same time keep erecting such inartistic buildings, is, to say the least of it, not only misleading, but tends to confuse the public mind, as well as bring contempt on the noble Art of Architecture.—Yours faithfully, "CECIL MAY."

THE Birmingham Lunatic Asylum Committee has decided to appoint Mr. George T. Hine, of Parliament Street, Westminster, who is frequently employed as assessor by the Lunacy Commissioners, assessor to advise the committee on the competitive plans sent in for the new asylum to be erected at Northfield.

Trade and Craft.

THE "ARFON" SLATES.

Our attention has been lately drawn to a slate that in the last twelve months has taken a vigorous hold on the market, and secured the approval of both the architects who have examined and specified them, and also the contractors who have used them. The two most necessary requisites for a good slate—viz., lasting colour and sound metal—depend to a large degree on a low percentage of lime; and as the "Arfon" slate, upon analysis, contains only 1.91 per cent. of this ingredient, good qualities are assured, which is accounted for by the fact that the quarry is distinguished from other American quarries for its isolation, being far distant from them, and in an entirely different formation—i.e., granite—while the others are in a limestone district. The "Arfon" quarries are situated in Virginia, and are owned and worked by men who served sixteen years apprenticeship in the Penrhyn quarries, and who accordingly are fully aware of the requirements of the market here. Their method of working the quarry and their experience stood them in good stead, as their slate so secured the favour of the U.S. Government that a great many of the national buildings have been now covered with them for a period of over thirty years, and the slate is as sound to-day as when first put on. We understand the "Arfon" slates were never placed upon the English market before November, 1896, although a small package was sent over to the London Exhibition as early as 1857, when they took the first award over all competitors, including the Welsh slates. Since then they took the first award over all others at both the Centennial Exhibition of 1876 and the World's Fair of 1893. Since November, 1896, large consignments have been brought into Leith, Glasgow, Liverpool, and London, where they have given the utmost satisfaction to the users, not only on account of their excellent metal and regular delivery, but also especially because of their great economy in laying, as the breakage is very slight. We understand that Messrs. Pearson Brothers and Campbell, of Liverpool, are the sole agents for the United Kingdom for the "Arfon" slates.

In the Church of St. Stephen-by-Launceston a finely-carved oak eagle lectern and pulpit, the centre of which portrays the martyrdom of the patron saint, has been dedicated.

In connection with the Manchester Municipal School of Art, the Technical Instruction Committee have arranged for a course of ten lectures to be delivered by Mr. Hugh Stannus, F.R.I.B.A., his subject being "Some Elements and Principles of Design in Classic Architecture." The first of the series will be given to-morrow, the 13th inst.

The Convent of the Assumption, in the Rue Cambon, is a bit of old Paris doomed to immediate destruction. Built in 1622, it became secularised in 1790, and has of late years served as a laboratory to the Ministry of Finance. The site will now be occupied by school buildings. The church, of somewhat later date, remains intact.

The work of construction of the South Pier at the Port Talbot Docks, Cardiff, has been disastrously affected by recent heavy gales. About 30ft. of the massive granite blocks, weighing several tons, were removed from their position by the heavy seas and ground swells which have swept the bar, and the damage is estimated at between £3000 and £4000. It is feared that it will necessitate the blowing up of the damaged portion and resetting of fresh blocks.

Some time ago the Llanelly Borough Council applied to the Local Government Board for permission to borrow about £4000 for purposes of sea defences. It was proposed to raise the embankment at the new dock about 4½ft., in order to make impossible a recurrence of the disastrous flood of October, 1896. The Council has now instructed the surveyor to amend his plans and increase the height of the embankment an additional 3ft., in accordance with a letter from the Local Government Board.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BARROW-IN-FURNESS.—For the erection of electric lighting station, Bugleuch-street, for the Corporation. Quantities by Borough Engineer:—
William Bradley £4,081 9 5 Thomas Brown £3,444 5 2
W. Saddler 3,510 0 0 W. W. Fairbairn,
W. Gradwell and 14,100 0 0 Barrow-in-Fur-
Co., Ltd. 3,447 13 10 ness* 3,386 10 0
*Accepted.

BRISTOL.—For the erection of a music-room, 157, White-ladies-road, for Mr. H. Hayman. Mr. H. Dare Bryan, architect:—
R. Wilkins and Son £460 John Perkins £461
E. Love 431 Cowlin and Son 386
Stephens and Bastow 413 Wm. Church* 327
*Accepted.

BRISTOL.—For the erection of offices and van-sheds, Whiteladies-road, for Messrs. C. Weeks and Son. Mr. H. Dare Bryan, architect:—
Wm. Church £1,547 E. Love £1,421
Stephens and Bastow 1,498 Cowlin and Son 1,383
John Perkins 1,458 R. Wilkins and Son* 1,139
*Accepted.

CRICCIETH.—For the erection of 2½ yards of sea wall, Messrs. Thomas Roberts and Son, Engineers:—
T. R. Bishop £2,570 0 John Hunter £1,435 0
R. Roberts 2,050 0 Griffith Williams 1,390 0
Thomas Bugbird and Owen D. Jones, Borth,
Son 1,761 0 Portmaddock (ac-
William Jones 1,598 0 cepted) 1,371 5
Evan Williams & Co. 1,471 11
Engineers' certificate £1,448.]

CROYDON.—For alterations at the Lion beer-house, Pawsons-road, Croydon, for Nalder and Collyers, Limited. Messrs. R. M. Chart and Son, architects, Croydon:—
Messrs. R. M. Chart and Son, architects, Croydon:—
Goulders' executor's £175 0 Bacon £128 18
*Accepted.

CROYDON.—Accepted for shops at Surrey-street, Croydon, for Mr. C. Evans. Messrs. R. M. Chart and Son, architects, Croydon:—
Bacon, Thornton Heath £1,288 5
*Accepted.

CROYDON.—For alterations at the Cannon public-house, Handcroft-road, for Nalder and Collyers, Limited. Messrs. R. M. Chart and Son, architects, Croydon:—
Hanscomb & Smith £267 0 D. Walier £215 0
Umlant and Nicholl 227 5 Goulders' executor's* 265 0
*Accepted.

DEWSBURY.—For the erection of ten thorough houses, &c., Greenwood-street, Dewsbury, for the executor of the late T. Lacy. Mr. T. W. Speight, architect, 28, Boothroyd-lane, Dewsbury. Quantities by architect:—
Masonry:—
M. Scott £1,664 5 0 G. Horsefall and 1,560 0 0
G. Whitehead 1,646 10 1 Son
J. Oldroyd 1,684 10 0 Blackburn and 1,435 0 0
J. Pickersgill 1,624 0 0 Hannan, Heck-
Crabtree and Den- mondwick* 1,529 2 6
ton 1,606 10 0 *Accepted.

DEWSBURY.—For the erection of ten thorough houses, &c., Greenwood-street, Dewsbury, for the executor of the late T. Lacy. Mr. T. W. Speight, architect, 28, Boothroyd-lane, Dewsbury. Quantities by architect:—
Joinery:—
T. Ellison £720 0 0 M. Wilson £559 0 0
J. Blackburn 642 7 9 W. H. Clegg 552 10 0
Lyles and Son 582 0 0 Richardson and 540 0 0
The Steam Joinery Son
Co. 573 10 5 H. Garthwaite, 465 0 0
I. B. Bailey 570 4 6 Dewsbury*

Surveying and Sanitary SUPPLEMENT.

JANUARY 12TH, 1898.

POLICE STATIONS AND PRISONS.

BY GEORGE H. BIBBY.

I.—INTRODUCTION.

IN Bridge Street, Blackfriars, was situated the Bridewell Hospital. The site was once occupied by a palace where Cardinal Wolsey resided, but later, and in the reign of King Edward VI., the establishment was endowed as a hospital "for the correction and punishment of idle vagrant people, and

at classification, the plan and the construction of the buildings rendering this difficult or impossible; the atmosphere was pestilential by reason of the fœtid breaths of beggars, drunkards, and diseased or filthy vagrants. Each ward was under the care of a superintendent, or keeper, whose remuneration depended upon the produce of the prisoners' work, and by the sale to them of spirits, tobacco, and other articles. The accommodation seems to have been chiefly in the form of day, or workrooms, connected with adjoining dormitories. There can be no doubt that the poorer prisoners, who could not afford to purchase food, &c., from the keepers, were treated with harshness and cruelty, perhaps almost as

such dark and unwholesome cells, and forthwith placed in the dock, in the strong light of a court, and before a large assemblage, without preparation, were not unlikely to be placed at a very unfair disadvantage. These cells may still exist, but, if so, it is probable that they have been improved.

At the present time the regulation size of cells for prisoners, in this country, is 13ft. long, 7ft. wide, and 9ft. high, thus giving an area of 91ft. and 819 cubic feet of space. In France and Russia the cells are smaller, being from 10ft. by 6ft., to 10ft. by 5ft., or even less.

At the Perm prison, in Russia, a room 27ft. long, 19ft. wide, and 10ft. high, is considered adequate as a residence for thirty-one prisoners,

LONGITUDINAL SECTION THROUGH CELL.

FIG. 1.

for setting them to work that they might, in an honest way, take pains to get their own livelihood." During the eighteenth century this prison appears to have been used, not only for the City of London, but also for the entire County of Middlesex. During a considerable period there can be no doubt that the Bridewell was a complete sink of iniquity—a den that could have no other tendency than to plunge the immoral, if possible, into a more profound state of demoralisation, and steep the wicked still more deeply in wickedness. In the long, low, and dark wards, persons of all ages, both sexes, and every degree of crime, were mingled without the slightest attempt

great as is common in Russian and other foreign prisons at the present time. But even at the time when the London County Council took over the Clerkenwell Sessions House from the County of Middlesex many of the cells in the basement (for prisoners waiting trial) were merely narrow coffin-like receptacles, unfit even for the temporary purposes for which they were used, while the insanitary closet arrangements were offensive in the extreme. As these cells were used for the detention of persons waiting trial, and not for those under sentence, many innocent prisoners must frequently have suffered, and it will be recognised that prisoners, suddenly called from

who thus are allowed a cubic space of about 165ft. each.

Now, while an English prisoner has a cell with a capacity of 819 cubic feet, a vagrant or tramp confined in a workhouse cell is frequently only allowed a cubic space of 360ft., the size of his cell being about 9ft. by 4ft. by 10ft., with an area of 36ft.

These figures show that the minimum accommodation for vagrants in workhouses compares very unfavourably with that provided in modern English prisons, and the latter also contain cells which have one-third more area than the lunatic asylum allowance for rooms for single patients.

FIG. 1A.

It is therefore obvious that cell accommodation under modern regulations is most costly in this country, in prisons or lockups, and that lunatic asylum single rooms exceed in cost the cells for vagrants in workhouses; thus the criminal is allowed more fresh air to breathe than either the lunatic or the able-bodied pauper!

If no water-closets be fixed in the English cells, the cubic space in these must be not less than 600ft., but, if otherwise, there must not be less than 819 cubic feet. It will therefore be seen that under all circumstances the provision for cubic space in cells is far more liberally provided for by the prison authorities than by the Local Government Board. Under the provisions of the Local Government Act, 1888, all police stations, justices' rooms, lock-up houses, judges' lodgings, assize courts, county halls, and shire halls, are now vested in the County Councils of their respective districts, but the County Council must, however, provide such accommodation and rooms as may from time to time be determined by the Standing Joint Committee of the Quarter Sessions and the County Council to be necessary and proper for the due transaction of business, the custody of prisoners awaiting trial, or removal after conviction, and other public purposes. The County Council may deal freely with these buildings, and may, with the consent of the Local Government Board, alienate them. There is nothing, therefore, to prevent such authorities from demolishing unsuitable or insanitary police stations, and erecting in their place suitable buildings of a modern and improved character, subject to the approval of the Standing Joint Committee.

(To be continued.)

THE new Refuse Dispatch Works erected by the Glasgow Corporation at Haghill, Parkhead, have been opened. The ground, selected as being the most suitable in the locality, extends to 15,192 square yards. Of that 11,012 yards are occupied by the works, leaving 4180 yards which can be utilised for feuing purposes. The cost of ground, buildings, machinery, and railways, and including the formation of a new street, amounts to about £2000. There are five furnaces for the cremating process, each with a firegrate area of 56 square feet. Steam is generated by the heat from the furnaces not only for driving the machinery for treating the refuse, but also for the lighting of the whole station by electricity. It is eighteen years since the Corporation decided to have refuse works, and there are now four such works in the city. Their total cost has been £126,000. Additional works are contemplated in the north-western and south-eastern districts.

DILAPIDATIONS.*

BY PROF. HENRY BUSHELL, F.S.I.

(Continued from page xxxi.)

IN considering the procedure necessary to schedule the dilapidations, it may be well to point out that this may be done either by the lessor's surveyor alone, or by the surveyor for each party surveying together, and agreeing, so far as possible, on the dilapidations and amounts; their "differences" may possibly be much lessened in consequence, and matters considerably expedited. In the latter case it would be prudent before commencing to schedule, to agree on a third surveyor or umpire to settle any differences. A somewhat recent work on dilapidations states that "surveyors settle ninety-nine hundredths of the dilapidation cases that arise without an appeal to the Courts," and a sentence spoken by the

* A paper entitled "The Practical Application of the Principles and Law of Dilapidations," read before the Auctioneers' Institute.

President in his inaugural address, to the effect that "competent surveyors, with open and candid minds, usually settle their cases; it is not always a sign either of wisdom or skill to appeal either to an umpire or a jury, although, at times, genuine differences of opinion in difficult cases make either one or the other imperative," serve to aptly illustrate the force of argument in that direction without any expression of my own, although I might be permitted to add that, from personal experience, I can endorse such to the full. If the first method be adopted, a schedule should be served on the lessee at or near the expiration of the term, with notice to repair, in accordance with the terms of the lease. It may be a matter of expediency to both parties if they can agree an amount in satisfaction of the dilapidations. The production of the schedule for the lessor to serve on the lessee is of such vital importance that I venture to emphasise the care, practical skill and judgment necessary when surveying for that purpose, and for deciding, after full consideration of the covenants and all the circumstances affecting the holding, the actual dilapidations together with the extent of such and their value. The original construction, type of building, and that all-important point, its age, the neighbourhood, and the degree or quality of repair calculated to satisfy the claims of that factor in the case who follows after, viz., the "reasonably-minded tenant" of the class who would be likely to take such premises, must all receive that proper amount of consideration which each demands to produce an "equitable" result. Personally I consider that the surveyor ill serves a client's interests, and is wanting in prudence, who, in cases of a vexatious nature, shows more zeal than judgment, and, yielding to flights of rhetoric or imagination, shelters himself behind general or sweeping clauses. These clauses themselves reveal a glaring inconsistency between the fabric itself and the covenants of the lease. I readily grant that, in scheduling dilapidations, certain general clauses are unavoidable, nay, are even desirable, but the flagrant misuse of whole sentences of formidable and irrelevant matter, is at least a questionable method of procedure. A schedule should call for as much either in point of quantity or quality in the way of reparations as can be demanded in view of all the facts, and no more, but the demand should be in terms clear, concise, and practical, and

LONGITUDINAL SECTION
THROUGH CELL

FIG. 2.

only a document prepared on the lines which I have indicated in the foregoing is a *bona fide* schedule, or one which will enable the surveyor to creditably undergo the searching examination of counsel. It must not be supposed that the schedule will fulfil the functions of a working specification, which alone in detail directs how certain work is to be performed, the quality of materials to be used, the market value of articles to be selected (to replace damaged or broken ones), and the constituent parts of materials when used in a partly prepared or compounded state. Any apparent misunderstanding in this respect, to my mind, suggests a not too clear conception of the real position. It is not customary, when serving a schedule of dilapidations on a lessee, to accompany such by a claim or to give an amount, although I consider it an advantage to the surveyor for the lessor, when taking the schedule, to assess the items. Notably those which may be termed the "spot" items are, of necessity, valued on the premises when the defect is under examination; other matters, of a more or less general order, may be valued at a later stage, or when completing the statement. In the matter of assessing dilapidations, it is unnecessary for me to expound the principles of pricing building artificers' works, as I made an attempt to do so in a previous paper, and my views upon this important section of work were then demonstrated. Much as I regret it, and although I have since had nearly two years to meditate on the subject, I see no reason to change my views. Further, as reference was then made to the point, I may be excused for advancing a strong belief that a quantity surveyor, properly qualified with a complete knowledge of the building trades, and provided he has a sufficient grasp of the legal effects of covenants, is one eminently adapted to make a capable dilapidation surveyor. I should like briefly to allude to an important case of dilapidations which bears on this particular point. A town house (not far from Hyde Park) was held under lease for twenty-one years. The term had expired, and I was instructed to survey the dilapidations for the purpose of making a claim. This was done, but there being considerable difference between my valuation and that of the surveyor acting for the lessee, the matter was referred to arbitration. The arbitrator (an architect of considerable reputation in the City) stated at the hearing that a very proper course had been taken by the surveyors in measuring the whole of the premises for the purposes of the claim. He would have done the same thing himself. Even the two surveyors' measuring books were tendered in evidence, and the measurements compared. I should like to caution the student of dilapidations against the improper use of price-books; for while admitting the excellency of these productions for reference, no price-book can, I

think, be regarded as a remedy for every individual ill that arises, without any consideration of the specific treatment which a case may demand. In fact, I go further, and have the strongest objection, generally speaking, to the adoption of such mechanical methods, and hold that in the main, even dilapidations should command an exacting system of pricing, with something beyond a lump sum, to indicate the argument. A builder's estimate, however, should not be taken for granted as conclusive evidence of the value of the dilapidations without proper investigation, but it often affords a good ground for argument. Moreover, in making a claim there are often special items to be included, such as undue depreciation of the fabric through neglect, or waste, questions as

to lessee's liability to pay rent during the execution of repairs, when done after the expiration of the term. The advantages of a joint survey to schedule dilapidations are considerable. With a qualified surveyor representing each interest, it is more than likely that a much more speedy and equitable settlement will follow. The majority of the dilapidations are agreed *en route*, and where lump sums are absolutely necessary, they should be agreed upon, or at any rate valued, on the spot. I certainly think that every schedule should carry an endorsement by the surveyor, which, in the case of a reputable practitioner, should be some guarantee of its accuracy, as is the case with bills of quantities prepared by well-known surveyors.

An Architectural Causerie.

Multiplex Regulations.

AMONGST the many troubles of the modern architect none are more vexatious than the multiplicity of regulations to which he has to conform, and their divergence, often upon matters of little or no importance, in different and even in neighbouring districts. First there is, of course, the Common Law of the land to comply

found to differ widely on two sides of the same street, if the two sides happen to be in different parishes, causing unexpected difficulties to arise, even where absolutely the same conditions prevail. Then every Company supplying a general commodity has its own rules—the gas companies, water companies, electric lighting companies, and hydraulic power companies—and all have to be complied with rigidly if these commodities are used. Just outside the metropolitan limits the confusion is even worse. London, large as it is, is completely encircled by a series of urban districts, each with its own bye-laws and its own formalities, many of these districts being populous and important—most important from the architect's point of view, as it is in them that most building is going on. If these districts could adopt the Building Act in its entirety, even if they administered it by their own officials, it would not only assist the architect, but would be greatly to the benefit of the architect, and would save the building public immense sums of money

country. The further from the metropolis, or some other great centre, the more lax are the regulations as a general rule, and the less efficient the official supervision in the public interest: and where there is ignorant laxity there is frequently ignorant harshness also upon some immaterial point. Doubtless, things are much better than they were before the days of bye-laws and of urban surveyors; but the present system is practical chaos, calling aloud for simplification and unification, combined with intelligent and highly trained supervision, independent of local control. But even this is not all. Buildings for special purposes have frequently to comply with the regulations of other independent bodies as well as with those already mentioned. A denominational school, for example, must comply with the rules of the Education Department, besides satisfying the surveyor of any body making a money grant in aid of its erection; while there are, again, separate regulations, administered by separate bodies, for hospitals, asylums, and almost every special class of building. As to a

OLD HOUSE AT IFIELD. DRAWN BY E. BECKITT LAMB.

with in regard to easements and rights of light; but this, being of universal acceptance, is no hardship. Local building bye-laws, however, differ widely. Within the metropolitan area the London Building Act holds good, and this alone is quite enough for any one practising man to have to master; but even this does not cover all points, and the vestry bye-laws may very possibly be

in the aggregate. But this is not permissible; they each have to formulate their own bye-laws, founding them, certainly, on the "model" set issued by the Local Government Board, but not precisely alike, and differing in unexpected places; while the rules as to deposit of plans and the filling up of forms are often most arbitrary and unnecessary. And thus it goes on all over the

vicarage, what with the Ecclesiastical Commissioners, Queen Anne's Bounty Commissioners, and other bodies concerned, the hapless architect escapes well if his hair does not turn grey before his first is completed. Of course, after the first of any special class, things become easier, the routine being known; but the annoyance caused by this multiplicity of rules remains. G. A. T. M.

"The Cantaliver Epidemic."

THE architect who lays claim to the title of artist is generally considered, by the ordinary layman, as a dreamer of dreams, a fashioner of fancies, altogether a most unreliable person. However able he may be to conceive a beautiful building, the primary laws of Architecture are brushed aside should they interfere with some pet fad, and construction is relegated to perdition should it oppose the design of an artist. When, therefore, one turns to the work of the practical "architect and surveyor," one naturally expects to find a sincerity in construction and truthfulness in design which will amply atone for any lack of those æsthetic qualities which an artist might supply. There is, however, a surprising modesty which one had never suspected in these gentlemen who are the exponents of nineteenth century "Architecture." The ostentation of the Greeks who revelled in beautifying the construction of their buildings is as far removed from these practical men as the monolithic style of the Egyptians. With a persistency of purpose worthy of better effects, they hide their light under a bushel, and the manner in which they achieve their wonderful results is an occult science known only to the few. Hand-in-hand with the engineer they daily sacrifice truth and sincerity upon an altar which has been reared to the great god "Expediency." In America they rejoice in skeleton structures of steel, with the interstitial spaces filled in by certain slabs of some light material; in London we can boast of a Tower Bridge, and every city can produce some huge structure apparently supported upon a vast expanse of plate-glass. The ingenuity displayed in the modern shop-front is quite appalling, creating the same sort of praise as that bestowed on a *séance* at the Egyptian Hall; yet any criticism of this method of building is met by the answer that the shopkeepers insist upon their wares being shown to the best advantage, and that it is expedient to eclipse construction in favour of an uninterrupted display in the shop window. Even from a practical point of view these shop-fronts have some objections. A writer on the recent fire in the City remarks that "large windows are one way in which fire can easily spread from one building to others opposite or near"—from an æsthetic standpoint they are absurdly incongruous. There are first principles which govern, or should govern, all Art, and these are founded on the laws of Nature. The engineer is trying to be wiser than the Creator; instead of covering construction he conceals it, which is quite a different thing. The Röntgen rays do not reveal any surprises in the construction, for example, of the human figure; the flesh, after all, is only a covering to the general supporting framework of the body. We are quite sure that the engineer must lament this lack of ingenuity, and no doubt could furnish us with many improvements. At present we are suffering from a cantaliver epidemic, and the ravages of this disease have left, and will leave, indelible marks on the face of our street Architecture. Is it not high time that some means were employed to prevent the further spread of infection? The revival of half-timber construction, so prevalent in modern domestic work, is a praiseworthy protest against the inroad of the engineer, yet cringing to by-laws and Building Acts, even this style of building is often a sham. Exposed "construction" which does not construct is a greater fraud than that of the hidden cantaliver. The original examples of timber houses might, indeed, lay themselves open to the objection that they are unnecessarily anatomical; that a man does not wear his ribs outside his body; why, therefore, should framing and studding be exposed to public

view? Even if there is nothing in this sort of criticism, the undeniable beauty and truth of these buildings cannot be utilised in modern street Architecture. It is evident we cannot expect the man of expediency to sacrifice his cantaliver for arch or column; perhaps, therefore, after all, we shall have to turn, if we want truth and sincerity in design, to the "dreamer of dreams" and the "fashioner of fancies," the architect who calls himself an "artist." H. S. M.

The Artist Joyboy.

JOYBOY—that was the name by which he was known to the other residents at Pagan House. Where he came from originally, who his parents were, or whether he had any, no one seemed to know, nor, so far as the writer could tell, did anyone seem to care; and yet, wait, there did come a lady who claimed him as nephew—but as she was stout, and the door but small, her visits were not so frequent as Joyboy would have liked. It was not that Joyboy loved his relative, but the occasional visit afforded him an opportunity of superintending the hoisting of his supposed aunt through the narrow door opening, an event to which he looked forward with his usual glee. After all, who among the residents at Pagan House, or, for that matter, those who visited him, cared to know anything of his ancestors. Joyboy was Joyboy—unique, inimitable, and, like old Plunket, who never went home, we all loved him. An artist to his finger-tips, a man from his heart outwards, one can only liken him to a many-stringed harp, with at least three always playing; but, unlike the prosaic orchestral harp, which stands silent awaiting the hand of the musician, the harp was played from within, till Pagan House vibrated and resounded with his cheerful melodies, making even the old and broken violin, the ancient savage, and the New Woman respond in curious unison. A spectral visitor might with reason have wondered why the violin was making frantic efforts to be tuneful, why the ancient savage began to dance some mad and thrilling orgie, and the New Woman to execute the first few steps of an almost forgotten waltz, and yet it was all so clear. It was Joyboy, the harp of Pagan House, twanging on the bath. Once only within the memory of the writer did Joyboy sit silent, the strings loose and limp as if they would never again become taut and tuneful, but time brought changes, and the Pagan house that once seemed empty echoed with joyous laughter, and then Joyboy strung up the harp within, and played outrageously from morn till eve, the sounds penetrated everywhere, until the ancient one, sadly knocked up from over excitement, fled, and the world of Joyboy knew him no more. Joyboy plays on from day to day—his posters, his book, and magazine covers, his modelling are but notes from his music-book, and great ideas hover round him. Bird-like he hops from drawing-board to easel, from easel to modelling bench, the work reflecting his joyous nature. From the smallest drawing to the large sculptured prize upon which he is working or playing there lingers some trace of Nature's beauty, and some flavour of the soil, of the bird on the wing, of the wind and the sky, and much of Joyboy. G. LL. M.

AN OLD HOUSE AT IFIELD.

THE old house at Ifield, Sussex, illustrated on our front page, is part of the ancient manor of Ewehurst. The view shows only a small portion of the building, which is partly surrounded by a moat in which water still remains. The Architecture is nearly all of one date, and contains some very interesting bits here and there. The drawing is from a sketch taken some years ago.

THE ANCIENT WALLS OF ROME.

TO BE OR NOT TO BE—PRESERVED.

IF the report be true," writes Mr. H. W. Brewer to the Daily Graphic, "that the ancient walls of Rome are likely to disappear, because neither the Italian Government nor the Municipality of Rome are willing to grant the small sum needed to preserve them from destruction, it is indeed a serious matter. Now, without wishing to wound the feelings of Italians by suggesting that they might obtain the sum necessary by a little more economy in other quarters, we may, at any rate, point out that it is obviously injudicious to expend money upon excavating antiquities if you allow these already above ground to fall into decay and be destroyed. Excavations, however interesting, may in such cases of extremity be postponed, for we can trust the 'kindly earth' to preserve safely for a few years longer what she has."

PRESERVED FOR SO MANY CENTURIES.

But no power can revive ancient historical buildings which have once disappeared. Now although everyone must admit that the excavations in Rome have resulted in 'grand finds' for the archaeologist, yet it may be doubted whether they are altogether an unmixed advantage, and whether the archaeological spirit of inquiry is not occasionally gratified at the expense of picturesqueness and artistic beauty. Take the excavations at the Colosseum as an example. From an antiquarian point of view the result achieved is eminently satisfactory, but who now would think of painting the Colosseum?—yet some few years back it was one of the most romantic and lovely spots in Rome. True the stations and other mediæval and Renaissance features were no portions of the ancient classical structure, and were like the beautiful climbing plants which

CLOTHED THE VENERABLE RUINS.

were intruders, yet what an enchanting ensemble they helped to form. We do not for a moment express an opinion as to whether this work at the Colosseum was right or wrong; no doubt much was gained, yet certainly something was lost, but in preserving the ancient walls of Rome the gain is sure and the loss nil. The walls of Rome are deeply interesting; those on the east bank of the Tiber follow the lines of and are in most cases absolutely portions of the fortifications set up by the Emperor Aurelian (270-275 A.D.), though they have been restored and patched up at various times, notably by Honorius, Theodosius, Belisarius, and later by many of the Popes. They also include fragments of a much earlier date than the time of Aurelian, in fact it is presumed that incorporated among them are portions of the wall of Servius Tullius, the sixth King of Rome (B.C. 578-534): for although the walls of Servius Tullius enclosed a far smaller area, one locality at least may have been common to both. The earlier portions of the walls are

CONSTRUCTED OF FINE BRICKWORK

with a core of rubble or concrete, but the later additions are for the most part of stone. In some places these varieties of construction can be distinctly traced. Aurelian's wall was about 50ft. high, and is said to have been defended by about 300 towers. Various ancient works of Art were, and in some cases still are, attached to these walls, such, for instance, as the Pyramid of Caius Cestus and the Baker's Monument. Baking, by the way, must have been a profitable trade in Rome, if we judge from the very beautiful monument, and the particular baker in question was certainly not only a prosperous man, but happy in his domestic relations, as the inscription beneath the statue of a beautiful woman seems to imply: 'My wife, one Atistia, a most excellent woman during the whole of her life; all that now remains of her is preserved in this bread basket' (the sarcophagus). We trust that even if the Government of Italy and the Municipality of Rome are unable to protect the ancient walls from destruction means may be forthcoming from other sources."

CAMBRIDGE

AND ITS NEW GUILDHALL.

BY HUBERT C. CORLETTE.

WE hope we may be permitted to congratulate the Municipality of Cambridge on their wisdom in selecting Mr. John Belcher as the architect of the new municipal buildings which they now propose to erect. And may we express the wish that the result of their deliberations may be of more substantial advantage to the town than has been the case with previous endeavours of a similar kind. We have often, in visiting Cambridge, been struck with the more than absurd exhibition which its present Guildhall provides, and it is particularly gratifying to any lover of the magnificent university, collegiate and ecclesiastical buildings of the town to feel that now at last some

by the way, notice that it must be very gratifying to the authorities at Cambridge to find that in one of these competitions their architect has proved himself able to win, even though his brother competitors are men selected from the first rank of their Art in England. However independent any corporate body may be, it cannot but be satisfactory to feel that the wisdom of their decision and choice is warranted by results in other cases such as this.

On hearing that the design for the new project in Cambridge was on view at the present Guildhall, we took the opportunity, during a recent visit to the University town, of looking at it, and at the same time examining the existing structures, for they are not one but many attempts, conglomerate, to meet the need of proper accommodation for the civil administration. The result in itself proves the little success of these several ventures.

It will, perhaps, enable us to explain more

inexcusable and lavish waste of money, as all patching and makeshift inevitably proves itself to be in the end. These delinquencies permitted by former members of the Corporation have made, naturally, many difficulties, which cannot have been easily overcome in planning what now we may hope soon to see realised by the execution of the design we saw with so much pleasure.

This design will, we think, be a distinct addition to the attractions of modern Cambridge. It is dignified without being too severe and quiet, yet, at the same time, it has many interesting features which give it a distinct character, such as we might expect from the artist who gave to London the new Institute of Chartered Accountants, of which Mr. Reginald Blomfield said, in the Magazine of Art for March, 1895: "The Institute of Chartered Accountants is a most original and remarkable building, doubly welcome in these days, when good Architecture is the rare exception. It is undoubtedly a bold venture in

THE OLD GUILDHALL AT CAMBRIDGE. - FROM A PHOTOGRAPH.

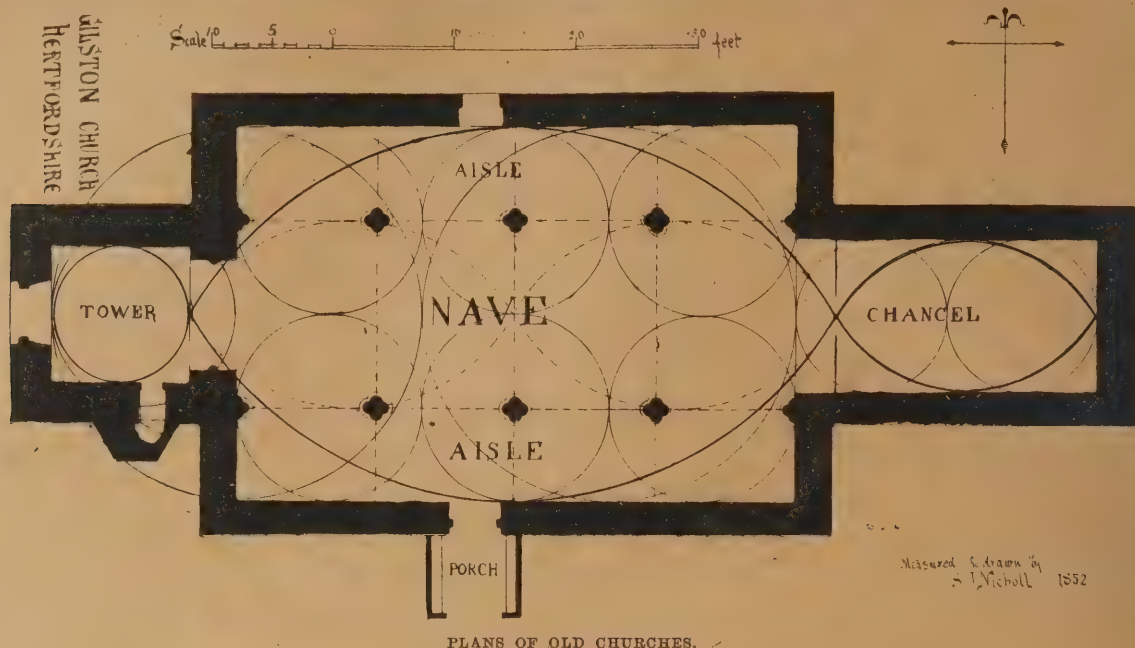

well-directed effort is being made to change the unsatisfactory condition of things in regard to its most important civic building. And we hope, further, that it may be a step which shall in some manner impede the progress there of some methods of design in other civic as well as domestic buildings. When we look at such places as the Oxford and Cambridge of to-day, despite the few excellent attempts to vie with the beautiful historic piles which must always reign supremely venerated in each, we cannot help feeling a little disappointed that a country which bewails the persistent destruction of the old magnificence of Rome, should calmly allow two of the most notable places in the world to be, with all too much impunity, made marts where wealth material is fought for in utter disregard of better things. From these few prefatory remarks we must now pass on to the main subject with which we have to deal—that is, the design which Mr. Belcher has prepared by request, and without the usual and most frequently unsatisfactory competition so-called, for the new Municipal Buildings. We might,

clearly what it is now proposed shall be done in order to overcome the present defective arrangements if we briefly notice them before saying anything particularly of the provisions comprised in the new scheme, which really, on close examination, proves to be a remarkably clever solution of a very difficult problem.

The present Guildhall proper, or Shire House, is an ugly and insignificant little building on the north side of the Market Square, which was built by Essex in 1782, not in the best manner then prevailing. To this have been attached at various times a collection of courts, departments for the other civil offices, various rooms for rather uncertain purposes, and a large public hall and free library. These have been contrived in all kinds of odd corners, with dark passages leading to them or not to them, as may have been intended—it is sometimes difficult to say which. And this, with such a waste of valuable space, and such an extraordinary arrangement in the levels of the various floors, that one is compelled to wonder who can have been responsible for such

design, but it is a venture of the right sort, guided by knowledge and capacity, and a true artistic insight into the essential qualities of Architecture. One would give whole streets full of frippery for a building designed with the courage and sincerity of the Institute of Chartered Accountants." And this, too, from the author of the lately published, masterly book on "Architecture of the Renaissance in England."

But though we say this of the external composition, we think it is necessary to know, as we do, something of the author's executed works, in order to understand fully what may be expected when it is completed in Portland stone—the material of which the front is to be built. The lines and proportions, as well as the whole grouping, have evidently been studied with a courteous regard for, and keen appreciation of, the situation in which the new pile is to stand. And this attitude of mind in a designer who is offered the opportunity and not all too pleasant responsibility—for it is so serious—of associating his work with some of the most valuable, venerable, and beautiful

PLANS OF OLD CHURCHES.

works of an earlier day, is most necessary for right success. But note the politeness, the absence of conceited self-assertion here. There is no great overawing tower and overweening presumption in the compilation, for, had there been, the University Church, which occupies a place on another side of the same market-square, might have been made insignificant by comparison. Then again, to all who are acquainted with the most valuable possessions which the Renaissance wave of the fifteenth and later centuries has left to posterity in Cambridge—a most important centre during that movement in the Arts of design as well as others—there is evidently a studied regard for the valuable aspects of tradition. For to see the suggestion for improving, without the frequent companion destruction, and then to look again at the older works in the same town based upon similar principles of design with this one, we may discover an aptitude to adopt proportions and a general scale which are in excellent harmony with the reigning beauties of the place. We should rather like to have found something to quarrel with in Mr. Belcher's production, but this courtesy and reticence disarms criticism of that kind. But we may perhaps take the liberty of suggesting that a little more subject figure-work might, under his hand, add value to the composition as a whole, especially since he has already been so thoroughly successful in this respect by his treatment of the Institute of Chartered Accountants.

The plan, after, as we learn, thirty years of procrastination, is now gathered together into a unity which will facilitate rather than obstruct the satisfactory execution of public business, and also make it possible for the Corporation to reap some benefit from their enterprise. In place of temporary erections for the comfort or discomfort of marketers and others in the sanitary sense, there are now provided lavatories and all the necessary conveniences at either end of the covered piazza, which runs from one end of the façade to the other. This, while serving the purpose of a shelter when necessary, is also useful in that it will allow carriages to set down guests at any point in its length, so that they need not be delayed as would be the case had all to drive up to one only entrance in turn. Entered immediately from this piazza is an entrance hall, on either side of which are the ladies' and gentlemen's cloak rooms, leading into a straight wide corridor, off which are various public offices and one of the lower halls.

There is another hall or large meeting room accessible directly from this main corridor by others of similar width. And arranged conveniently with regard to these halls are other retiring rooms, and some kitchen offices,

and a servery, also a secondary and private staircase which is also the direct approach to the School of Art on the top floor.

From the entrance hall just mentioned visitors would cross the main corridor and proceed immediately on up the wide flight of the grand staircase which rises by an easy gradient in two stages up to a vestibule and large crush room at the entrance to the present great hall. Grouped close to these are the robing room, the aldermen's parlour, the mayor's reception room, the council chamber, the courts and other accommodation for the use of municipal officers, with some committee rooms. But while we may admire the convenient arrangement of these various rooms, we very much admire the really splendid planning of the staircase, which is so much the more satisfactory because it has been contrived as a legitimate outcome of the necessary elements of the plan and without sacrifice of these in order to obtain so fine an effect. We do not remember having seen so good a staircase in any modern work of recent date, and shall certainly go to Cambridge for the express purpose of seeing it when the work is completed. And we hope that, for the sake of British industries, British materials may be largely used in its composition.

The lighting, ventilation, and generally masterly contrivance exhibited by these plans is a pleasant contrast to the absence of these things in the present buildings.

We thought we had found some ground for severe criticism in the absence of some room on the same level as the large hall, which could be used as a supper or refreshment room on the occasion of a ball or similar entertainment. But, upon examination of the levels in the sections and the very easy flights of the staircase, we were quite satisfied to find that the lower hall, as intended, would serve this purpose, as it is so easily accessible from the upper one in which any dancing would take place.

A new history of the Town and University has just been published for Mr. T. D. Atkinson by Messrs. Macmillan and Co. We feel that there will be more than enough material for another valuable and interesting chapter when the project we have been discussing has been completed.

An important scheme has been devised for widening the streets around the Manchester Royal Infirmary, and for setting out as an open space, to which the public shall have access, a considerable portion of the Infirmary grounds. It is proposed that the Corporation shall purchase from the Infirmary Trustees about 12,000yds. of land at a cost of £286,000.

PLANS OF OLD CHURCHES.*

By S. J. NICHOLL.

HOWEVER strong our individual predilection may be for pointed arch, traceried window and clustered pillar, as members of the Guild, we first take note of the structural evidences of ancient ritual in the church we are examining of its varied form in plan; and the development of its arrangement; in fact, of its ritualistic history; in this light every form of plan becomes of importance to us even if visits to them are only in the future.

We visited a few years ago, under the guidance of Mr. Alexander Wood, a group of churches within easy reach of Shoreham; one, that of Sompington affords us an early example of a transeptal church in which the south transept retains the original arrangements of one chapel projecting out from the eastern side; whilst in the northern transept two chapels have replaced the original form, with however a central recess between the chapels; perhaps in continuity of the primitive intention.

The Norman church at Porchester retains but one transept; this has on its eastern side the arch which once opened into a single chapel as at Sompington, a typical arrangement in its simplest form.

Another type of plan which I will only allude to, it having been described on a previous occasion (Ballintober Abbey and Variations in plan), is that of St. Lawrence, Castle Rising, which retains at the sides of its chancel arch the two recesses, apparently a continuation from the primitive arrangement exemplified in the basilica in the Cimiterium Ostriatum, just as the majority of our old parish churches still, and our new ones will, I hope, continue the aisled arrangement with terminal chapels in evidence of the perpetuity of the basilical traditions.

The transeptal arrangement with apses to the east, north, and south, seems to have been originally derived from the plan of such an edifice as that above the catacombs of Callixtus, in which Pope Sixtus II. was martyred in the year 258. It was in shape a square hall with three apses. This building, razed nearly to the ground at the time of the martyrdom, was restored in the time of Constantine, and its plan, as that of a schola or memorial hall, might have been considered more appropriate for the church of a joyful mystery than that of the tomb of a martyr and so adopted for the Church of the Nativity at Bethlehem erected by Constantine. There may be, however, doubt as to the original plan, some now

* A paper read at the Guild of SS. Gregory and Luke.

holding the idea that it may have been rebuilt by Justinian on account of present eastern position of the altar for the western position of the altar, facing of course the east, was so imperative at that period that when Constantine erected the church over the tomb of St. Paul, he had to restrain himself to the smallest dimensions on account of the limited space, 100ft. between the tomb and the eastern boundary of the site, which was the Ostian way. Later on, in 386, ampler dimensions were obtained by rebuilding westwards; the altar at the east end still retaining its original position with regard to the tomb which was undisturbed.

The noble Church of S. Sophia, in Constantinople, seems to offer authority for a great variation from the early models, but it has its apsidal recesses in evidence of conformity with the customary ritual arrangement. At first sight the western recesses would seem to be in sacrifice to the idea of architectural symmetry; but it is probable that when rebuilt by Justinian with the altar eastwards, the western recesses were renewed in reverent remembrance of the ancient arrangements; just as we see the western apses retained in Liège and in some churches on the Rhine, and which is conjectured to have been the case at Canterbury previous to the fire of A.D. 1067. Of the plan of S. Sophia we have no exact example within reach for our visits, but the outer wall of the east end of Norwich Cathedral with apsidal chapels recalls the intention.

Of another venerable type, that of the Church of the Holy Sepulchre, as repaired by the Crusaders, we have several examples in England, one at our doors in the London Temple. I exhibit a plan of the Jerusalem church made by J. J. Scoles in 1824, for comparison with that of the temple or other round church within our radius to which some day we may pay a visit.

In the consideration of these plans of old churches we must feel how closely every part is in harmony with the ritual; not merely subservient but conceived with it; and beyond this, how perfect they are as works of Art; harmonious also in proportions and symbolic in design. The plan of the Egyptian temple has been described as typical of Mystery; the ancient Greek temple as of Rationalism; and

the mediæval church as of Aspiration. This is too large a subject to do more than to mention, as is also that of symbolic and geometrical proportion. On this latter point I had the pleasure last session of raising a discussion, if not of convincing, by the exhibition of several sections of ancient churches large and small, and in continuation of the idea I exhibit a plan of a thirteenth century church—that of Gilston, Hertfordshire. I present this plan in particular because it is drawn from measurements carefully taken by myself for another purpose. It was only after I had laid it down on paper that I found out its proportions.

It will be seen by the plan that the length of the nave to the width measuring across the nave and aisles is three to two, that the total width is divided into four equal parts, two being given to the nave and one to each aisle, the length of the nave being divided into four equal parts for the four arches of the nave arcade.

The chancel, the width of which is fixed by that of the nave, is exactly two equilateral triangles in length from the eastern wall to the screen; whilst the nave and aisles together are in proportion again, that of two equilateral triangles from the screen to the square or circle which is enclosed by the tower.

I do not think these proportions were accidental, neither do I think the question to be merely academic. Coincidences of harmonic proportions in form and sound are now accepted, and may have influence on the acoustic qualities of buildings; and our neglect of the principle may be one of the reasons why our new churches do not please us as the old ones do—and therefore worthy of note in our investigations.

The altar, the universal central object in our old churches, is the one that was most thoroughly and systematically cleared away, and very few vestiges have we been fortunate enough to come across in our visitations. We measured a large altar mensa in Cobham and at All Saints, Huntingdon, which, thanks to Mr. Temple Layton, we visited in July, 1891. We noticed a simple reredos of good design at the end of the south aisle.

The moulded jamb, and two of the mullions of the four light windows, were continued downwards, so as to leave a plain space in the

centre of 4ft. 10in., showing us the length of the altar, which was all we could be certain of.

This year I had the opportunity of examining what is known as the sealed altar slab in Norwich Cathedral, preserved through it having been placed face downwards in the pavement at the desecration. In the mensa, which is 5ft. 9in. long by 3ft. 3in. broad, there is a sinking in which a marble slab, 1ft. 10½in. by 1ft. 8½in. broad, considered to be the seal, is placed. It has been lifted, and no relics were found in the cavity, which was pretty well filled with mortar. The marble slab is placed 2ft. 8½in. from the Epistle end, and only 1ft. 2in. from the Gospel end of the altar; the inserted stone, therefore, is within 1½in. of being entirely on one half of the mensa; so that if the priest celebrated on this super-altar, which I think it was, he would be quite away from the centre of the altar.

The chapel was the Jesus Chapel, and the B.S. was reserved here; and I suggest that this singular arrangement may have been in consequence of the Presence. The priest at the altar would never be between the suspended pyx, or other form of tabernacle, and the people.

In the Church of S. Denis, Liège, I found at a side altar what, from its dimensions and the presence of the five crosses and the seal, I take to be an example of the super-altar inserted in the mensa. It is 14in. square, and the crosses are of the form so usual in mural consecration crosses, with curved spreading arms in a circle 2½in. in diameter. The relic cavity with its seal is 2½in. wide, by 2½in., and is 1½in. back from the front edge.

In the crypt of the great church at Grantham, I found an altar which had a large cavity under the top slab in the centre of the face of the altar, in which such a stone as that found in Roche Abbey, Yorkshire, may have been inserted, following what seems to have been the custom in England. I extract the description of a reliquary stone, for such it may be called, from an article by Dr. Fairbank, in the transactions of the Yorkshire Architectural Society for 1890. On the "north side of the entrance to the choir of Roche Abbey, on the site of an altar, a stone was found, a cube of nearly 9in. square on each face; on one side, covered with colour-wash, a quadrangular

PLANS OF OLD CHURCHES. TRACED FROM THE ORIGINAL DRAWING BY S. J. NICHOLL.

portion had been removed and replaced; within the cavity was found a small capsule of sheet lead 2½ in. long and one across, and inside of this were two small fragments of bone and two portions of a link of chain armour." With these evidences I am inclined to believe that the so-called seal at Norwich was a super-altar let into the mensa as at Liège, and that the relics were, in the usual English form, in the body of the altar. Another form is evidenced in an illuminated letter in a MS. in which the consecrating bishop is represented as replacing a portion of the mensa which has been cut out from the front top edge; and a stone, if it is an altar-stone, which I saw in the cloisters of St. Croix, Liège, may have been so consecrated. It is marked with six crosses—three in a line at either end; the front-central portion has been cut entirely away and is missing.

When in our visit of June, last year, we saw St. Andrew's, Great Staughton, Bucks, our attention was drawn to a scripture in an old form, well carved on an oak panel, now forming part of a bench, but which probably was a portion of a parclose, "Of your Charyte Pray for the good aistate of Oliver Leader and Frances hys wyfe. Anno Dni 1539;" and we constantly come across such evidences, not merely of the continuance, but of the growth, of Catholic devotion and faith up to the very moment of the suppression. An example is the tomb of John Spelman, an ancestor of the antiquary who died in 1545, in Narborough Church, Norfolk. It is an Easter sepulchre of the simplest form, but with a representation of the Resurrection; indeed, in Greene's "History of Worcester," it is shown that the ceremony of the Sepulchre survived until the second year of Edward VI.

For other notes on the Easter Sepulchre I go back to our visit to Shoreham and its neighbourhood, when we examined what is known as the Lewknor tomb of Tudor character in the church of Kingston-by-Sea.

It is an altar tomb with arch canopy, having in the centre under canopy a mutilated sculptural group of the Resurrection, on the sinister side of the Blessed Trinity, and on the dexter side of our Lady of Pity. In the frontal of the tomb there are three shields in quatrefoils, left in high relief as if intended for carved bearings, never executed. In the apex there is a carved demi-angel holding a shield, mutilated like the rest of the sculpture, and therefore probably having been of religious significance. The Lewknor arms, "argent three cheyrons azure," are on a shield in the glass of an adjoining window and on the beam of the rood across the chancel arch.

In Hamsey Church, near Lewes, there is a tomb with a similar canopy and an identical frontal, but there is no sculpture corresponding to that at Kingston. This is known as the de Say, or founder's tomb, but the Lewknors had property here, and both tombs may have been erected as Easter sepulchres. In an article in the "Sussex Archaeological Collections," it is conjectured as the work of a Lewknor who was groom-porter to Edward VI. and died in the Tower. The upper part does not appear to be certainly of the same date as the lower, and it may have been restored and re-erected for its original purpose by this Lewknor.

In Shoreham Church, again, there is a sepulchre of similar form. The frontal of the tomb has an arrangement identical with that at Kingston, of three quatrefoils enclosing shields, and four upright panels for figures, but with end piers in addition, probably intended to carry the canopy; under the existing canopy there is a demi-angel with shield. In this monument, like that at Hamsey, there is a doubt about the upper portion, that is the part proper to the Easter sepulchre, which may have been taken down and afterwards reinstated to something near to its original design.

I have remarked on the absence of heraldic

bearings in these tombs. Quite different in that respect is the magnificent tomb, in the neighbouring church at Broadwater, of Thomas West, 8th Lord la Warre, who was born in 1458, and died at Offington in 1526. He directed by his will that he should be buried in his tomb of freestone, within the church at Broadwater. The tomb, therefore, must have been erected during his lifetime (not soon after, as described in some accounts), so that it may have been erected by him as an Easter sepulchre, as it stands in the usual position of the sepulchre. Also, by his will, he gave his mantle of blue velvet of the garter, and his crimson gown belonging thereto, to make two altar cloths. His wife Eleanor died in 1536, leaving instructions for a priest to sing for her for the space of one year.

The tomb is of the altar form, with a canopy of three cusped arches carried by pendants. The whole work is profusely enriched with heraldic bearings and badges, including the leopard's head jessant de lis of Cantilupe, and the crampet of the scabbard of the sword of John, King of France, granted as a badge of honour to Sir Roger la Warre, for having received at Poitiers, in 1356, the sword of the King of France. The front of the tomb has alternately square panels with shields and narrow panels as in the three I have already quoted, but the shields very small, on a draped field, have the armorial bearings carved, and the panels have mutilated vestiges of sculptured figures, nimbed. In the centre, a standing figure, has radiating rays all round; from this and the outline I judged it to have been the Blessed Virgin. Under the canopy there is a carved shield enclosed in the garter, but without the supporting angel. This monument is interesting as an example of the introduction in the carved brattishing of the cornice, and in the pendants of Renaissance ornament, probably the work of a French artist. The general design is English Gothic.

The succeeding Lord la Warre, Thomas, who died in 1532, was buried in a counterpart of the Broadwater Monument at Boxgrove. He is said to have signed the letter to Pope Clement VII. in favour of the divorce, but afterwards was doubted and in danger of the King's enmity, as appears from the letter addressed to the King by Cromwell and others (Ellis Original Letters, vol. ii., p. 123), "We have employed all our most diligence, industrie, and activite." "But as yet we can find no sufficient ground to committe him to prison in your Grace's Tower." Nothing is known of the offence he was suspected of. He pleaded earnestly though in vain, to Cromwell for the Benedictines of Boxgrove, and he may have been suspected justly of an endeavour to return to rectitude and the old ways, such a return as the monument I am about to describe may evince.

It is the reputed tomb of the next la Warre, who died in 1554, the year following the accession of Mary, and is in the south transept of Broadwater Church, opposite the end of the south aisle. Of complete Renaissance design, it is altar-like in form; the frontal has a large rectangular panel in the centre, now quite plain, and upright panels at each side which have evidences of mutilated figures; above the altar or tomb there is a sort of reredos, within the centre the mutilated evidence of a seated figure on a throne with a nimbus of radiating points, whilst in the side panels are perfect figures of Our Lady and Child and St. George. Above is a projecting coved canopy, with demi-angels and shields, the whole at present crowned by a molded and carved cornice. As I have said before, the whole of the detail is of Renaissance character, a further development of the change evidenced by the portions of the first monument described; but the effect is good, and with its overhanging coved canopy, so general in the late Gothic chantries—as, for instance, Abbot Bird's in Bath Abbey, and in some of the French woodwork lately acquired by the South Kensington Museum—I cannot but feel that it must be a chantry altar rather than a tomb.

In Cartright's "History of the Rape of Bramber," speaking of Broadwater (p. 38), he says: "At the east end of the south aisle was a monument, of the same style as last, to

Thos. la Warre, who died in 1554 it is now (1830) taken down to be repaired when taken down it was discovered that one of the niches contained a figure of the Virgin and Child, and another of St. George, carved in stone, in good preservation; they were covered by a pew." But the version now told is that they were preserved by having been built in with the face inwards. It is known that several chantries were destroyed in the first quarter of this century, and I suggest that this may have been the altar of one of these, and, if so, of great interest to us as a work of the revival under Mary.

A suggestion of a development in arrangement was given to us this year in the Church of SS. Peter and Paul, Purtenhew, Co. Bedford, where, on the central arch of the chancel screen we should ordinarily expect to find in a scripture some allusion to the rood, we read "Transfiguratio Domini Nostri Jhesu Christi."

May not in this case the great Crucifix have been in stained glass, in a painting or in sculpture over the high altar, and another mystery selected for the entrance to the chancel? The great reredoses become, as I have before suggested, the image-bearers; and when, as at Winchester, the rood was so important a part of the reredos, and of such large size, the repetition of the same subject directly in front of it might seem to be out of place.

Another instance of devotional and architectural growth may be noticed in the old churches of Eastbourne and its vicinity. At Eastbourne, in the thirteenth century, eastern responds of the nave arcades, shallow recesses, or niches have been sunk, apparently for the reception of paintings or enamels of saints, probably of the dedication of the adjoining side chapels.

The same idea has been similarly carried out in the neighbouring churches of Pevensey and Westham. These recesses are evidently of much later date than the piers into which they are sunk, and portions of the stonework have clearly been inserted; but in the late perpendicular Church of St. Clement, Hastings, the idea is more fully carried out by canopied niches which form part of the original design and construction of the two easternmost pillars of the arcades, which corresponded ritually with the responds of Eastbourne.

Those members who joined in the visit to Dunstable Priory will remember the portions left in the arch on the north side of the ancient nave of a very ornate screen of Renaissance design; and we constantly see evidences of roods having been erected but to be at once destroyed.

Our pilgrimage this year was mainly prompted by the fact that the church of St. Neots was largely filled with stained glass by Mr. John Powell, whose work we esteem, and whom we keep so affectionately in our memory. We had also the pleasure of seeing in the same church the excellent work of another member of the Guild—Mr. Walters—the Rowley monument. More than this remembrance would be out of place in these notes.

An architect's notes must, I fear, be but dull reading. He may have a measuring rod, but it is not a rod such as was given to St. John, it is only a two-foot rule, and however pleasing may be the searching in old shrines for evidences of past glories, the enumeration of them is not an inspiring work.

St. John saw a glorified basilica in its full glory. We have to study denuded sanctuaries. Happily, it requires but ordinary vision to see how our old churches were built up with the old faith and the history of our people, and to feel how intimately they are bound up with our sympathies.

YORK HOUSE, Twickenham, is undergoing an extensive process of renovation and decoration to prepare it for the Duc d'Orléans, who is shortly to take up his residence there. There has been as little interference as possible with the fine old Elizabethan work which is so characteristic a feature of the interior; but in some of the principal rooms the ceilings have been renewed in the Louis XIV. style, and the electric light has been provided throughout the building.

A TIMELY PROTEST.

THE ABUSE OF STREET ADVERTISING.

WE have received the following letter from Mr. Richardson Evans, Secretary of the National Society for Checking the Abuses of Public Advertising:—

"At a meeting of the Council of this Society the annexed form of memorial was adopted for presentation to the London County Council and the several Metropolitan Vestries. It is proposed that it should be signed by Mr. Waterhouse, as President of this Society, and by London architects who are in sympathy with the views expressed. It is thought that by limiting the signatories to a class peculiarly qualified to speak both on the business and the æsthetic aspect of the question, a definitely influential expression of opinion would be secured. May I therefore request that you will in your courtesy publish the draft of the memorial, and permit me to ask all architects to send me the necessary authorisation to add their names."

"May I add that the proposal to erect an electric sign in Edinburgh recently was so strongly condemned by local sentiment that the firm which proposed to resort to the expedient abandoned the design in avowed deference to public opinion."

"It will, of course, be understood that, although illuminated signs furnish the immediate occasion for the memorial, the system of

regulation contemplated would apply to all the recent developments which destroy the architectural effect of our streets.—I am, Sir, your obedient servant,

"RICHARDSON EVANS.

"January 14th, 1898."

[Copy of Memorial.]

"We desire respectfully to invite the attention of your honourable body to the practice, recently introduced and rapidly extending, of advertising in the public thoroughfares by means of large illuminated letters or other emblems. The architectural value of one of the most beautiful sites in Europe—Trafalgar Square—is thus nightly destroyed. We are aware that you have not at present any legal faculty of control, and our purpose is to suggest to you the expediency of applying to Parliament for such power as may enable you to deal effectually with this and cognate abuses."

"Some time ago an attempt was successfully made to throw advertising notices by the aid of a flash light on Nelson's Column. The Vestry of Saint Martin-in-the-Fields appealed to the Government, and the result was that this particular form of the practice was abandoned. In this special case, public sentiment was affronted by the disrespect shown to the memory of a great Naval commander; but we believe that there is a feeling hardly less strong, and even more widely diffused, regarding the progressive degradation of the metropolis by the displays on private premises."

PLANS OF OLD CHURCHES: CHURCH OF THE NATIVITY, BETHLEHEM.

We submit that reasonable regard for individual liberty requires that those who wish to use public thoroughfares shall not be subjected to annoyance at the discretion of the owners of adjacent buildings. It must be for the duly constituted local authorities to decide to what extent the appeal to the eye shall be permitted. In the absence of regulation, the evil must indefinitely extend both in range and in offensiveness. For it is a maxim of puffing advertising that the more brutal the attack on the sight the stronger is the impression left. If the proprietor of one preparation gains an advantage in this way, his competitors will be forced in self defence to neutralise his gain, by setting up eyesores—if possible more aggressive—on their own account. Trade does not benefit in the long run, and the public suffer.

We desire to see enforced a principle which, while covering the case of illuminated signs, would necessarily apply to all advertising devices of a similar character.

The fundamental issue, we submit, is whether the people of the metropolis are to be molested in the use of public thoroughfares; whether the interests of the inhabitants of a great city, in maintaining the dignity and beauty of its aspect, are to be sacrificed to the rivalry of certain classes of tradesmen; whether Architecture and scenery are to be converted at the caprice of individuals into an insignificant background for the brawls of competing makers and vendors.

In an age when so much is done at the general cost to improve the public taste and provide Art training, it is, to say the least, inconsistent to permit wanton disfigurement of our finest sites. The legislation (for London) regarding sky-signs has checked one mischievous development, but the principle of regulation has still to be carried to rational lengths.

To prevent misapprehension let us add that we contemplate no interference with such methods of advertising as are either in themselves artistic or are consistent with dignity and propriety in the aspect of our City. The praiseworthy efforts recently made to improve the posters would be encouraged by imposing a limit on the coarser modes of seeking publicity. Even on mere grounds of safety to life and limb some of the illuminations must be pronounced most objectionable. The rapid alternation of flash and darkness is not only distressing and injurious to human eyesight, but must add greatly to the difficulties of drivers and pedestrians, especially at an open space with a network of crossings like Trafalgar Square. Nor can it be doubted that, in some localities, the vulgarising effect of these displays must tend to depreciate the value of property.

MR. C. J. INNOCENT, architect and surveyor, of Sheffield, has removed his address to 22, High Street.

THE Old Toll House, on the road between Slough and Eton, has fallen into the hands of "the housebreaker," and is about to be demolished.

DR. INGRAM, of Peterborough, states that during the last seventeen years between £30,000 and £70,000 has been spent on the restoration of Peterborough Cathedral, and that a further sum of £8000 is required to complete the work, £2000 of which is needed immediately.

ANOTHER place in Paris destined to suffer from the modern craze for alteration is the Nouvelle Librairie, at the corner of the Rue de Grammont, on the Boulevard des Italiens, an establishment which, despite its name, is of considerable antiquity now. The Nouvelle Librairie is to be transferred from its old site to No. 11, Boulevard des Italiens.

EXTENSIVE alterations at the Bath Railway Station have been completed, the principal improvement being the removal of a block of business premises on the up side, which has allowed the platform outside to be greatly widened and lengthened. A new entrance has also been made, with separate booking-office, and the old footbridge has been done away with in favour of a more convenient structure.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
January 19th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Colne School Board has received the report of Mr. Royle, of Manchester, the adjudicator on the competitive plans for the erection of a new Board School. The awards were:—1, £20, Mr. W. H. Atkinson; 2, £10, Mr. John Varley, both of Colne. The plans of Mr. H. Holgate, of Colne, ranked next, but there was no third prize. The Board resolved to appoint Mr. Holgate architect for the schools.

MR. M. H. BAILLIE SCOTT, architect, who has recently been engaged in designing, decoration and furniture for T.R.H. the Grand Duke and Grand Duchess of Hesse, in the Palace at Darmstadt, is now commissioned by H.R.H. the Crown Princess of Roumania to design the decoration and furniture for a country house in Roumania. The house in question is constructed entirely in the trees, some considerable distance from the ground, and the irregular shape of the rooms gives many opportunities for quaintness of treatment.

It is a pity that the demolition of the Paris fortification walls cannot be delayed until after the 1900 Exhibition. Architects would then be alive to the need of providing stabling for motor cars. There is no place for such machines in the ordinary Paris house. Cyclists who live on fourth and fifth floors have to carry up their steel horses. The Paris architect is a product of schools. He is not very practical, and he generally works for capitalists who go in for cheeseparing and other savings. As a consequence, the domestic Architecture of Paris, however new, is hardly ever up to date. They are far more advanced in the new districts of the German cities. Paris water was not laid on in flats before the war. It was carried up to kitchens by Auvergnats, who sold it at the rate of a penny a can. One may now pay 6000f. or 7000f. rent, and not have a bath-room; but one will have a gilded drawing-room with a painted ceiling. Doors drag, and do not close well. Sometimes they seem obstinately bent on not opening. There is no ventilation, unless one throws open casement windows, and chimneys are so bad that if a neighbour above or below one's flat has a slow combustion stove one is liable to be asphyxiated by the fumes.

As originally intended, the British Fire Prevention Committee commences active work with the new year, all preliminaries having now been completed. The number of members with which the Committee starts nearly

reaches 300, and comprises the leaders of the different professions interested, together with a particularly large general representation of architects, surveyors, and civil engineers. The general organisation has been in the hands of the Chairman of the executive, Mr. Edwin O. Sachs, with whom the idea of the Committee originated, and among the 300 original members who are supporting the scheme are, to mention architects, Professor Aitchison, A.R.A., Pres. R.I.B.A., Sir Arthur Blomfield, A.R.A., Mr. Blashill (the superintending architect), Mr. Arthur Cates, the Crown surveyor, Mr. Darbyshire (Manchester), Mr. Douglas (Glasgow), Messrs. Mountford, Aston Webb, &c.; whilst of surveyors practically the whole of the London District Surveyors joined, with Mr. H. H. Collins, the President of the District Surveyors' Association, and the city surveyors or engineers of the large provincial centres like Glasgow, Dublin, Manchester, Birmingham, Newcastle, Leicester, Wolverhampton, &c., &c.; the engineers to County Councils, as for instance, Sir Alexander Binnie, of the L.C.C., &c. Of other professions the various branches of engineering are represented, for instance, by Sir Douglas Fox, and Mr. Preece, F.R.S. (Vice-Presidents of the Inst.C.E.), Sir William Bailey (Manchester Ship Canal), and Mr. Alexander Siemens; the Universities by Professors Barr (Glasgow), and Ewing, F.R.S. (Cambridge); the Science and Art Department by Major-General Festing, F.R.S., and Sir Norman Lockyer, F.R.S.; the House of Lords by the Earls of Stradbroke and De La Warr; the House of Commons by Major-General Russell and Colonel Tomlinson, and our civic authorities by Alderman Treloar. The theatre has Sir Henry Irving and Mr. Tree on the committee, as well as among others, Messrs. Terry, Hollingshead, Penley, &c., and the lighter forms of public entertainments are represented by Sir Arthur Sullivan, Messrs. Kiralfy, Moul, Morland, &c.

GREAT care has been taken as to the representation of the different interests, and, though architects and engineers are naturally in the majority, none of the sections affected have been neglected. As to the general policy of the Committee regarding fire prevention, this will be decided at the meetings which will be shortly held. The question of independent tests for "fireproof" materials, &c., on the lines adopted in New York and on the Continent, will, however, have immediate consideration, and Mr. Sachs is collecting particulars from the States and the Continent. Similarly, questions of general construction, the Building Act, &c., will be immediately dealt with. The issue of publications on the subject has already been commenced, and a library has been formed. Among the papers already in preparation are contributions on the Cripplegate Fire, on Construction, Safety of Electrical Installations, Theatre Safety, Regulations, &c., and a number of abstracts from Continental and American literature will also be issued. Among the contributors of impending papers are Messrs. Bridgman, Max Clarke, Darbyshire, Farrow, Goad, Sachs, Wordingham, &c. The offices are at No. 1, Waterloo Place, and all enquiries should be addressed to the assistant secretary.

TWENTY-TWO competitive plans for the proposed new fire station at Bootle have been sent in, and these were exhibited in the Town Hall. The author of the selected plans will receive the appointment of architect of the buildings, and a second prize of 25 guineas is also offered. The scheme, excluding the cost of the site, which is situated in Irlam Road, is not to exceed £15,000, and in the event of the Local Government Board refusing to sanction the borrowing of the money the successful competitor will receive 50 guineas as remuneration for his work.

THE Coates Memorial Church, described as "the most magnificent Nonconformist church in Europe," to which we referred in these columns last week—and which, by the way, is at Paisley and not at Blackburn—was designed by Mr. Hippolyte G. Blanc, A.R.S.A., of Edinburgh. As we mentioned last week, in all the

fittings and accessories the utmost refinement and finish is displayed; and we now learn that the choir stalls, organ transept screens, and gas-fittings were all supplied by Messrs. Jones and Willis, whose name has become so largely and so honourably associated with church furnishing. The work was executed from Mr. Blanc's own designs, and, without a doubt, is very beautiful.

At a meeting of the Truro Cathedral Building Committee it was reported that the foundations for the nave were completed. The treasurer stated that the available funds were about £24,000. It was decided to continue the work and to appoint Mr. F. L. Pearson to carry out his late father's designs for the completion of the nave.

An appeal has been issued by the Archdeacons of Gloucester and Bristol, and the vicar of the parish, in behalf of the restoration fund of Tewkesbury Abbey. It states:—"It is not too much to say that Tewkesbury Abbey is the noblest parish church in England. Larger than many cathedrals, second to none for its historic associations, enriched with architectural features of matchless interest, with its massive Norman nave and tower, and graceful decorated choir and ambulatory, this famous abbey is one of the few survivals of the great destruction which followed the dissolution of the monasteries in the sixteenth century. The inhabitants of Tewkesbury—then, as now, a small country town of 5000 people—saved their church, which, with its monastic buildings, was actually scheduled for destruction, by a large money payment to Henry VIII. For three centuries great efforts have repeatedly been made by them to preserve it from decay. Seventeen years ago the restoration of the interior was completed at a cost of more than £11,000, the work having been carried out under the supervision of the late Sir Gilbert Scott and his son, Mr. J. Oldrid Scott, the present architect of the building. Feeling the immense importance of preserving for future generations their noble church, the Abbey Restoration Committee have resolved once more to appeal to the generosity of churchmen at large to aid them in completing the restoration of the whole building, and providing effectually for its future substantial maintenance and care. For this a sum of £10,000 is needed, to be thus employed:—(1) £7000, of which from £2000 to £3000 will have to be immediately expended in repairing, and in many places renewing, the roofs of nave and transepts, that of the north transept, immediately over the great organ, being now in a very deplorable condition, and in arresting the decay rapidly going on in the stonework of the walls; the remainder to be invested so as to provide a permanent fabric fund, by means of which the whole building may be constantly attended to. (2) £3000 to be invested in order to efficiently maintain the spiritual work and services of the church."

When the Houses of Parliament re-assemble in February the most noticeable alteration which has been carried out during the recess will be found to be the extension of the electric lighting system, which, for some time past, has been gradually replacing the existing illuminant. It is interesting to recall the fact that as far back as the year 1839—five years after the destruction of the House of Commons by fire—the question of lighting came prominently forward, and various experiments were made with the Bude system, which was adopted a year later. The cry, however, was still for more light, and hence in the early fifties we find further experiments being carried on with Dr. Reid's system, the principal recommendation of which was that it rendered unnecessary the massive candelabra which were so familiar a feature in old prints of the period. After a time the popularity of gas brought about another sweeping change in the lighting of the senatorial chamber, and this, in its turn, is now giving way to the claims of electricity.

In a paper read before the Eastbourne Natural History Society, on the subject of

"Sussex Churches," Mr. H. Michell Whitley, F.G.S., said that the churches of the county were full of interest to the careful student of Architecture. It had been well said that the small village church was the special glory of England, and nowhere would they find more perfect examples than in this county. The earliest type of church was introduced during the Roman occupation of England. The earliest Saxon churches built after the landing of Augustine were of wood. There were probably numbers of them in Sussex. When the English began to build in stone they naturally imitated their previous constructions in wood, in carrying out the idea of upright wooden framing, and one of the most characteristic features of this period was the use of what was called "long and short work" for quoins. Examples of this were found in Arlington Church and the tower of Jevington. Saxon sculpture was rare, but there were two most interesting examples in Chichester Cathedral. Speaking of Norman work, the lecturer said the apse and tower of Newhaven were the best examples in the district, and Pevensey was spoken of as a good example of an Early English Church. Although Sussex was not rich in large churches, few counties possessed as many Saxon and Norman ones, and he had been specially struck with this in visiting the churches in the Eastbourne district. With the exception of Hailsham, Pevensey, and Alfriston, he had found Saxon or Norman features in all the churches of the district, and even those churches which had been rebuilt probably stood on the site of the older buildings. In Eastbourne they had an example of a large church which ranked with Rye, Winchelsea, New Shoreham, Etchingham, Horsham, Alfriston, and Poyning in the first class of ecclesiastical buildings. Reverting to Eastbourne Parish Church, Mr. Whitley spoke of it as a fine example of a large church which had remained practically unaltered from the date of its erection. One peculiarity of Sussex churches was the occasional occurrence of round towers. There were three, Piddinghoe, Southease, and St. Michael's, Lewes, all in the valley of the Ouse.

Attention is being called to certain regulations which the authorities have lately been enforcing in Birmingham, with regard to the lighting of basements by the insertion of glass slabs in the pavement, which regulations, it is complained, are a serious curtailment of the privileges which property owners have hitherto enjoyed. Prior to the retirement of Mr. W. Till from the office of city surveyor the rule was, it is said, to allow pavement-lights a foot wide along two-thirds of the frontage in cases where they were desired, the Corporation exacting no payment and making no special conditions. The result has been that a very large number of business premises have been so planned as to admit of the use of the basements for offices, showrooms, and so forth, the value of the property being thereby considerably enhanced, and the rates being proportionately enriched. Some time ago it was intimated to persons who were about to erect properties on these lines that the pavement-lights would only be sanctioned subject to payment of 5s. per annum for each light of 6ft. by 2ft., the arrangement to be terminable at three months' notice. Agreements to this effect were entered into in some cases; but other persons concerned have taken the view that not only is the exaction of a rental for the use of the pavement-light illegal, but that the reservation as to the continuance of the light seriously vitiates the property-owner's title, rendering the leasing of basements so precarious as to leave no alternative but to revert to the primitive cellar or comparatively dark storeroom. It is stated, however, that the regulations may subsequently be modified.

The directors of the New Gallery are to be congratulated upon having organised an excellent exhibition for the winter season. It comprises ancient and modern pictures of the British and Continental Schools—excluding living artists—and a special selection from the works of Dante Gabriel Rossetti, which includes examples of his work in oil, water-

colour, crayon, pencil, and pen and ink. The various loan exhibitions that have been held from time to time at the Royal Academy, the Grafton, and the New Gallery have doubtless tended to exhaust the supply, which naturally must be limited, and it is surprising to find so much freshness and variety pervading the present collection. Possibly the North Room will be the most popular of any. Here are sixty-four pictures, mostly by deceased painters of the British School, and many of them excellent specimens of the masters.

An important discussion, re the legality of a sanitary order, took place last week before Mr. D'Eyncourt at North London Police Court. The summons was taken out against Mr. Harold Morris (one of the City Commissioners of Sewers) in respect of the drainage of a house owned by him at Wyatt Road, Highbury. The case was before Mr. Bros at the court in November last, when the order was made that all sanitary defects should be remedied, but without specifying the particular work.—Mr. Bramall was proceeding to show wherein the magistrate's order had not been complied with, when Mr. Bodkin took objection to the summons on the ground that the Vestry had failed to comply with sub-section 5 of section 5 of the Public Health Act, which said that if the person upon whom the order is made so requires, the public authority shall specify exactly the work required to be done. There was no doubt as to the defective drainage, and the only question was as to whether there should be the smoke or the water test.—Mr. D'Eyncourt said the best way would have been for the defendant to have mandamus Mr. Bros to further hear the case. He (the speaker) held that the order on the face of it was a perfectly good one, but he would grant an adjournment so that each side might interview Mr. Bros on the matter.—The adjournment was accepted.

LONDON is losing its old landmarks at an alarming rate. In the neighbourhood of Holborn the course of destruction has been particularly noticeable during the year gone past. The demolition now in progress, of a number of ancient houses on the north side of that thoroughfare, will cover with oblivion many a spot of historic interest. The clearance begins at Furnival's Inn. Thence the labours of the "housebreaker" extend to the famous "Old Bell," which has already been razed to the ground. Between these two points two other licensed houses, pleasant with the flavour of bygone days, and more than one building with an interesting history, are doomed. Ridler's Hotel, which is to be rebuilt and enlarged, is a relic of the early days of the Queen's reign, and the removal of the present structure means the destruction of the "Horse and Groom," at the corner of Leather Lane. It is one of the quaintest hostels in London.

MR. THOMAS F. RIDER, president of the National Association of Master Builders of Great Britain, has sent the following communication to the Hereford Association:—"The present condition of the relations between capital and labour make these associations necessary in every town of importance. At present there is comparative peace, and the masters should close up their ranks and prepare for the inevitable contest. The engineers set a splendid example, and until the employers in the building trade make it equally clear that they intend to be masters over their own business, and, whilst recognising trade unions in their legitimate sphere, will submit to no dictation on the part of those associations in carrying on trade, there will be nothing but this irritating condition of affairs, ruinous to employers and employed alike."

An interesting discovery has just been made in the town of Reigate in the form of a portion of a roadway believed to be of Roman origin. Some workmen, whilst engaged in excavating for a sewer in Nutley Lane, discovered a completely-formed roadway about 5ft. below the surface of the highway. The path is about 14ft. wide, and is composed of flints, the edges of which have been trimmed to fit, and is

altogether of a very even character. By some local archaeologists the path is considered to be a continuation of the noted Pilgrims' Way to Canterbury Cathedral, which passes through the town of Reigate, and which can be seen on the side of the road leading to Reigate Hill; while others, seeing that the path is composed of flints, contend that it formed part of the old Roman road from Winchester to London. The road passed over the hill, and the district was known as Ridge Gate, altered in later years to Reigate.

The Corporation of London has deposited a Bill under which power is sought to borrow £80,000, which it is proposed to expend upon the enlargement and improvement of their Foreign Cattle Market at Deptford. For the purpose of extending this market it is proposed to acquire a large area of houses and lands now forming part of Grove Street, Barnes Terrace, Prince Street, and Watergate Street, and, in connection with this extension, it is proposed to construct four sections of railways for the purpose of forming a communication from the market to the Deptford Wharf branch of the London, Brighton, and South Coast Railway. A short single line of tramway is also proposed connecting with these railways, and the right is proposed to be conferred on the Admiralty of improving the access to the victualling yards at Deptford "by means of such junctions with the proposed railways as may be approved by the engineer from time to time appointed for that purpose by the Corporation."

ST. GEORGE'S CHURCH, Liverpool, has been finally closed. What will become of the structure? Probably many of the relics it contains will be preserved, and especially so in the case of the beautiful stained-glass window, the subject of which is "The Crucifixion." This would certainly adorn either one of the other of the two edifices which will be erected elsewhere to replace St. George's and St. John's, that is, provided, the fabric of the former is not rebuilt on another site. It is interesting to note that the design for the window was painted for the Corporation by the late Mr. William Hilton, R.A. The canvas, which measures 200in. wide and 229in. high, occupies a prominent position in the Liverpool Museum.

As every citizen of Leeds is probably aware, there is a covered service reservoir on Woodhouse Moor, extending across the south-east end. Some years ago, when the Corporation undertook to make the Moor more attractive, by the laying out of flower-beds and the planting of shrubs, it was seen that the roof of the reservoir might also be turned to good account by the gardeners. The brick arch forming the roof was accordingly covered with soil to a considerable depth, and an ornamental garden laid out. Many years have passed since the reservoir was formed, and probably not even the city authorities knew what was the real strength of the structure. The laying of many tons of earth upon the roof encouraged the belief that the arch was of a very substantial character. Recently a considerable portion of the arch collapsed, the superincumbent mass falling, of course, into the reservoir. It was then discovered that the arch was only half a brick thick.

FURTHER alterations are being made in more or less famous places studding the boulevards in Paris. Workmen have been engaged pulling down the mosaics, designed by Forain, and all the other gorgeous ornamentation from the front and side of the Café-Brasserie Riche. This ill-fated establishment, well-known to Londoners, is about to undergo another transformation scene. Formerly it was one of the old-fashioned cafés blancs, with the traditional blinds in the windows, the plush-covered seats, and the marble tables. A few years since it was turned into a branch of the Royal Beer-house of Munich, and the café became a brasserie. Now it is to be closed for another metamorphosis, and will not re-open until we are within very measurable distance of the next Universal Exhibition of Paris.

WITH the object of hastening the construction of the proposed new defensive breakwater at Portland, the authorities invited public tenders, and there was a keen competition among leading firms in the country. For some time past a number of men have been employed on the preliminary works connected with the breakwater by the Admiralty, and the Admiralty's New Works Department submitted a tender with others. The contract, however, was secured by Messrs. Hill and Co., Government contractors, of Westminster, and the whole machinery, plant, etc., now in the hands of the Admiralty, will be taken over by them, and the work proceeded with with all despatch. The time limit for the completion of the huge undertaking is four and a half years.

WRITING on the subject of wages in the building trade, a correspondent—"Nemo"—says:—"Whilst the supreme selfishness of the new unionists has been clearly demonstrated, there is one phase of their tactics to which attention has not been sufficiently, if at all, directed. I refer to its effect on the efforts being made to improve the dwellings of the classes, some above and some beneath them in social status, but all earning lower salaries or wages. Many more rich men would build suitable dwellings if they could see their way to a safe reasonable profit, say four per cent., and many landlords would lay out much more in repairs and improvements if they could be effected at a reasonable rate. But here the British workman comes in, and with his arbitrary rules as to wages and restriction of output becomes a hindrance. 'Duty towards one's neighbour' has with them become an obsolete doctrine. The following extract from a letter received in reply to one from me, complaining of a builder's account, but enclosing a cheque, illustrates what I say:—"My forty-three years, in business in — has been one continual stretch of hard work, and in it I have seen some changes. You say in your favour 'the bill seems very heavy for the work done.' I cannot deny it, but whose fault is it? It is not mine; it is the excessively high rate of wages paid to the men, who give in return much less work in a day than when their wages were cent. per cent. less! Joiners get 95 per cent. more than when I started business on my own account. Bricklayers get 90 per cent. more; labourers 120 per cent. more, and, as I said before, do less work for it, and whilst their wages have been going up the employer's reward has been going down."

To the long list of losses which the Royal Academy has lately suffered another has been added by the death of Mr. Stacy Marks. Born in 1829, the son of a solicitor who, curiously enough, quitted the law to carry on a family business as a coachbuilder in Langham Place, Stacy Marks began to study at the Royal Academy schools in 1851, after having been once rejected as a probationer. Fresh from his tutelage, Stacy Marks went to Paris, where he lived with his friend Calderon in one room "in perfect amity, poor but content." After five months of this idyllic existence, he went back to Newman Street and began his first picture—a half-length figure of Dogberry. The British Institution would have none of it in 1853, but the Royal Academy was kinder to the young artist. The canvas was hung next to Mr. Holman Hunt's "Strayed Sheep," and it sold immediately for £15.

CONSIDERABLE opposition has been manifested in Westminster against the proposal of a syndicate to continue the Embankment westward of the Victoria Tower of the Houses of Parliament, and demolish a considerable extent of property in the neighbourhood with the view of erecting a better class of houses, and a special meeting of the Vestry was called to consider the proposal. It was explained that the scheme entailed the removal of buildings of the rateable value of £40,119. After reading several letters of opposition to the scheme, the Vestry decided by twenty-eight votes to six to instruct counsel to oppose the bill on its behalf.

THE six distinguished painters who now, for the third time in succession, unite to bring forward a very agreeable exhibition of landscape at the Dudley Gallery, are once more Mr. R. W. Allan, Mr. J. Aumonier, Mr. James S. Hill, Mr. A. D. Peppercorn, Mr. Leslie Thomson, and Mr. E. A. Waterlow. The exhibition consists mainly of substantial and sufficiently-finished studies—by which is not meant merely sketches—with a good sprinkling, however, of pictures in which something a little beyond the faithful reflection of Nature is intended. What strikes the visitor agreeably, even in a first casual inspection of the collection, is that we are here in the presence of genuine Nature-lovers, whose first aim is not to proclaim allegiance to any particular school or branch of modern Art, but to depict unaffectedly, and with all artistic means at command, the simplest, but not the least touching, beauties of landscape.

MR. G. C. HAITE has completed the picture of the Jubilee procession on which he has been for some little time engaged. He has had as collaborators in the work two Italian artists, by whom some of the larger foreground figures were painted; but he alone was responsible for the delicate colour scheme, and for the luminous treatment of the background and accessories.

THE medals, prizes, and certificates gained by the students of the architectural, mechanical and electrical engineering, and mathematics classes of the Regent Street Polytechnic were distributed at the Polytechnic on the 10th inst., by Mr. Sidney Webb, chairman of the Technical Education Board of the London County Council. Mr. Robert Mitchell, the director of education, reported that the students of the architectural and building trades' classes had been most successful in the examinations held by the various public examining bodies. The number of students attending the evening engineering classes during the past year had exceeded that of any year since the Institute was opened, and the work done both in the class-rooms and at the examinations had been in every respect eminently satisfactory. Mr. Sidney Webb, in the course of his address, said that when the great new University for London came into existence, which he hoped would be the case either this year or next, it was very important that the Polytechnic should see that its work came within its scope, and that what they did entitled them to a University degree. The students of the classes should not be disheartened if they did not see how their attendance at the evening classes was to bring them extra wages or bigger salaries. He was rejoiced to see craftsmen of every sort crowding into an institution like that. Many of them were aware that he was a firm believer in trade unionism, but no trade union would be able to get better wages for any class unless the workmen themselves were proficient. They should come out of the rook and show their employers that they knew more than they were paid to know. The middle class had in the main ruled this country for the past fifty years, and ruled it on the whole to great advantage, but that was because the middle class had in the past been inspired with great ideas, and they would cease to rule unless they continued to be inspired with large ideas.

ONE beneficial result of the control of the London County Council over theatres and music halls has been the increased attention given by the owners of places of amusement to the protection of their audiences from fire. All the new suburban theatres are specially well equipped in this respect, and at the Brixton Theatre, the Shakespeare Theatre, Battersea, the Broadway Theatre, Deptford, the Grand Theatre, Fulham, Balham Town Hall, and at the Theatre Metropole, Camberwell, the latest Merryweather hydrants and fireproof curtains have been installed. The same firm are also fitting a new asbestos curtain at Drury Lane Theatre, where they have for many years attended to the fire-extinguishing arrangements.

THE PRIZE AWARDS.

THE awards—or rather the non-awards—of the Royal Institute of British Architects this year are a disappointment. Of the studentships and prizes offered by the Institute every year for the encouragement of the student of Architecture, no less than four have this year been withheld. The decisions of the Council were announced at the conclusion of a business meeting held—with Mr. E. A. Gruning, vice-president, in the chair—on Monday night. The awards are as follows:—

THE ROYAL INSTITUTE SILVER MEDAL and 25 guineas for essay.—Subject: A review of English Architecture of the nineteenth century.—One essay only was submitted, and the medal was not awarded.

THE ROYAL INSTITUTE SILVER MEDAL and 10 guineas for measured drawings.—Subject: Measured drawings of ancient buildings in the United Kingdom.—Awarded to Thomas Tyrwhitt; medal of merit to Cyril Wontner Smith. Six sets of strainers were submitted.

THE SOANE MEDALLION for design, and £100 for Continental travel and study of ancient buildings abroad.—Subject: Design for a concert hall.—Five sets were submitted, but the prize is not awarded.

THE PUGIN TRAVELLING STUDENTSHIP: Silver medal and £40 for travel in Great Britain and Ireland and study of mediæval buildings.—Four sets of strainers were submitted, and the studentship is awarded to C. de Gruchy; and a medal of merit to Benjamin Bower.

THE OWEN JONES TRAVELLING STUDENTSHIP: Certificate and £50 for the study of ornament and colour decoration.—Two sets of strainers; studentship not awarded.

THE TITE PRIZE: Certificate for Design according to the principles of Palladio, Vignola, Wren, or Chambers; and £30 for travel and study in Italy.—Nine designs were submitted, and the prize awarded to John Stevens Lee; a medal of merit and ten guineas is awarded to Thos. A. Pole.

THE GRISSELL GOLD MEDAL and £10 10s. for design and construction.—Subject: Design for a small country church. Twelve designs were submitted, and the award made to Harbottle Reed, a medal of merit being given to W. Stanley Bates.

THE ALDWICKLE STUDENTSHIP: Certificate and £50 for travel and study in Spain.—Awarded to James B. Fulton.

ASHPITEL EXAMINATION PRIZE: Not awarded.

THE ARTHUR CATES PRIZES, for testimonies of study prepared by students for the final examination. June, Percy Morris; November, Laurence Hobson.

The reports of the Pugin (1896 and 1897), Aldwinckle (1896 and 1897), Owen Jones, Soane and Godwin students, it was announced, were approved and confirmed by the Council.

Mr. Ernest George will read a criticism on the awards at the next meeting of the Institute to be held on Monday, the 24th inst., when the various prizes will be distributed. The presidential address to the students will be delivered at the same meeting.

The exhibition of prize drawings opened on Friday in the galleries at 9, Conduit Street. The drawings submitted by the travelling students are very fine. Mr. A. E. Henderson, the Owen Jones student, has been to Stamboul, and there found several exceedingly interesting designs. Mr. J. A. R. Inglis, the Soane medallist, gives evidence of his visits to Palermo and Verona, and Mr. A. T. Griffith, the Aldwinckle student, has been working on Spanish scenes, and in these displays his great talent to the best advantage. Other students who are exhibiting are Messrs. R. S. Ayling, the Godwin bursar, W. Haywood, the Pugin student, and C. C. Brewer. Five have entered for the Soane Medallion and a purse of £100, and these have submitted designs for a concert hall to seat 3000 persons, including a small chamber concert hall to accommodate 300. The regulations of the London Building Act had to be observed.

COMPOSITION IN REGARD TO
PUBLIC BUILDINGS.*

By F. T. BAGGALLAY.

THIS subject, which six months ago I rashly undertook to write upon, is a vast one; embracing really no less than the whole field of architectural design; and, although I shall confine myself to its æsthetic side, it will not be possible to do more than deal very superficially with a few points even of that. It is, too, as elusive and slippery as an eel; no sooner does one begin to feel a more or less firm grip upon some part of its complicated anatomy than doubts arise, and the chase has to be begun again. It perpetually leads to the quicksands and dry deserts of philosophic inquiry into the function of Art and foundations of beauty, where one meets the mirage of a logical reason for doing what one wants to do, and it leaves one at last floundering in the ocean of uncertainty that surrounds the firm ground of knowledge. The hydra heads of this provoking subject are the principles that should govern the composing of the various parts of a building into a pleasing and harmonious whole. And though it might be taking things more in order to try to seize its tail first, and discuss the building up of a moulding or a single curve,

THE INCIDENTS OF THE CHASE

may possibly be a little less wearisome if I attempt to grasp the heads. The composition of the completed building is really the true function of the architect. In a properly organised system the details and ornamentation would be left to the various trained craftsmen, who could, and would, be trusted to work in harmony with their chief and with each other. But ours is a disorganised system, under which no harmony can be attained unless the architect himself composes or, as we say, designs the details also, or has them efficiently copied from others which he can choose. The latter alternative has come to be universally condemned, and properly so. But the condemnation has been so noisy, and the attention it has attracted has been so great, that detail still continues to hold the absurdly prominent position it attained when all Architecture was judged by the correctness with which

THE DETAILS WERE COPIED.

In connection with any other matter, the admission that anything is a detail is sufficient to relegate it to at least the second place in our consideration; but in connection with Architecture, it is often the only thing that is even noticed by the critic. Our only historian—because, from the Renaissance up to his time architects generally borrowed a number of ornamental features and most of their detail from ancient buildings—proceeds to heap contempt upon all modern Architecture as mere copyism, and goes so far as to tell us that true Architecture “expired” at the Renaissance. Most critics, in fact, have for centuries awarded praise or blame to architectural works on the merits or demerits of their ornamental details alone, at one time praising “correctness,” and more recently originality. Few and scarce have been the writers who gave a thought to such things as light and shade, grouping, proportion, scale, character, and expression—except so far as the

ORNAMENTAL FEATURES

were affected—who were able to lay aside the microscope and the dissecting knife, and study the lines and pose of the model. The fact is, those critics of Architecture who have succeeded in being heard have too often been men of literary and general, instead of architectural culture, men to whom the ornamental part was the more obvious, and more easily understood. On the ornamental details their attention had been naturally fixed, and to such an extent that, for a time, they persuaded even architects that Architecture was a matter of columns and cornices, or of window tracery and mouldings, or of something vague to be invented to take

the place of these things. Mr. Fergusson himself was in no sense an architect, though a picture gallery is said to have been erected from his design, and he looked at Architecture from the outside only, and, with all his careful comparison of photographs and book illustrations, never seems to have succeeded in seeing anything but a number of different systems of ornamentation which he could number and ticket and criticise for the astonishment of the public, and the confusion of students. It is said that originally his æsthetic sensibilities were not deficient; but if that is so he had certainly succeeded, before he wrote his history of modern Architecture, in choking them with philosophy and burying them under a mountain of statistics. Yet even Mr. Fergusson might have avoided, if he had not been blinded by a complication of preconceived opinion and far-fetched theories, the gigantic mistake upon which he founded his indictment of modern Architecture, the mistake of supposing that decorative features first began at the Renaissance to be imitated from older buildings. Had it been true, it would have been no proper foundation for a sweeping condemnation of modern Architecture. But it is not true; it is so far from true that in every age there has been far more imitation than original design in architectural ornaments; so much imitation, in fact, that, in most cases, “copying” would be the better word. The Egyptians, when they wanted columns and capitals and cornices for their temples, did not invent them, but copied in limestone and granite the bundles of reeds and the accidental forms of their earlier mud structures, and continued to copy them with but slight modifications to the end. The Doric temples were absurdly exact copies in marble of the more ancient wooden ones, even to the nail heads. The details of the Ionic order were borrowed from Asia Minor, and some say the Corinthian also. The Hellenic Greeks, beyond adding a degree of finish due to their greater mechanical skill, never got very far from their originals.

THE ROMANS BORROWED GREEK DETAILS

by the bunch, and in most cases without any alteration (except that they struck their curves instead of drawing them by hand), and applied them in their own way to their own uses, precisely as the Renaissance architects afterwards applied Roman details; and the Romanesque was but Roman work badly copied. The variations that were developed in the details of the pointed styles of Western Europe, in the three or four centuries through which they lasted, were, it is true, considerable; but even they were developed very gradually, and under exceptional circumstances, that are not likely to prevail more than once in a thousand years or more. It is very doubtful, too, if the successive changes were made consciously; it is just as likely that the men who first made them thought they were working the same forms their fathers wrought before them. Imitation—or, if you will, “copying”—is inevitable as regards architectural forms; and, moreover, it is the only road to improvement. It is not in the power of the greatest genius that ever lived to invent any great number of entirely original ones that will at the same time be acceptable. Those who have been least unsuccessful in the attempt have only succeeded in being absurd, while of the rest the less said the better. New forms must grow gradually, and will inevitably do so if we do not persist in harking back, or in trying to make fresh starts; and if we are not too vain to imitate where we cannot improve, nor too lazy to improve if we can. We

NEED NOT COPY,

like the Chinaman who made a dozen cracked slates to a cracked sample; but we shall never get on at all if each man tries to invent a brand-new style of his own. On the other hand, neither shall we get on if we condemn a fresh variation, merely because it clashes with our preconceived notions. What we must ask is—is the change an improvement, or is its freshness its only justification?—freshness is always delightful—and if so, is the justification sufficient, or has something more important been lost in the shape of actual

* A paper read before the Architectural Association on Friday night.

beauty or significance? In this matter a distinction may be drawn between details that are purely ornamental additions to the general composition, with which fancy can safely sport freely, and those which have a functional character, either constructive or as emphasising any line or form in the composition; any change in these seems to demand some greater justification than its novelty. After all, the time and energy expended by architects in trying to freshen up the elements which go to make up their compositions seems as if it might be rather thrown away when we think that painters and sculptors have to use the same elements that their predecessors have been welding into works of Art since the beginning of time. Architecture, of course, is an Art on a very

DIFFERENT BASIS TO PAINTING AND SCULPTURE;

but there seems no adequate reason why the architect should not regard his building very much as the sculptor regards his group—as something to be moulded into a thing of beauty as a whole, though the elements may be as hackneyed, as a quotation from Shakespeare. Should anyone ask, ironically or otherwise, how this heterodox theory is to be carried into practice, it must be confessed that the best of answers is very unlikely to be satisfactory. The only consolation is that if a painter or sculptor were asked a similar question with reference to his art, the reply would be no better. If these things could be done by rule, there would be no art in doing them, and they would cease to interest anyone. The world has long ago agreed that most of the skill to do them well must be born in a man, and that very little of it can be put into him by his own efforts, and still less by the precepts of others; and the world is no doubt right. The most that can be done is to call attention to certain matters that seem to have led to success in particular instances, and, therefore, presumably, may do so again. But first it may be well to note what is the character of the elements at the architect's disposal, as compared with other artists. While the painter has the whole scale of colours to draw upon, and every line in Nature or in art; the sculptor, all natural forms; and the musician, all conceivable sounds;

THE ARCHITECT'S CHOICE

in each direction is limited. Sound he cannot use at all; his colours must be confined to such as time, exposure, and use will not seriously change, and, externally at least, must be mainly those of his building materials; and his forms must be such simple ones as economic conditions impose upon him as a builder. He has, however, the immense compensating advantage that he can use not only both form and colour as elements in his composition, but also the finished productions of his colleagues, the painter and the sculptor. It is also noteworthy that, although he cannot create interest by making his building tell a story or represent a familiar scene, he has no need to do so, since his creations have a definite purpose, and therefore an innate interest of their own which he can bring out and possibly emphasise. One of the first things to remember, and, considering the many temptations to forget it, perhaps the most important, however elementary, is that

A BUILDING IS NOT A FLAT THING,

but an object of three dimensions, having depth as well as breadth and height; and that the best results cannot be obtained unless this is made obvious to the spectator. A comparison of the Church of St. Saluté at Venice with the Grimani Palace, or of Vicconti's buildings of the Louvre with the Palace of Versailles, or of the Horse Guards' building with Inigo Jones's Banqueting House, may indicate my meaning. All these buildings are supposed to be excellent works of Art, although they come under Mr. Fergusson's description of "modern" Architecture; but while the church in Venice, the Louvre in Paris, and the Horse Guards in London look like complete buildings, the others, as far as appearances go, might be only ornamental walls. Two, the Saluté and the Horse Guards, seem to me unsurpassed as

examples of architectural modelling; and it is worth noticing that Kent's success in this was obtained in spite of the always discouraging difficulty of having not a single large chamber, but a number of small rooms to deal with. Mr. Fergusson, of course, affects to despise the building, being apparently offended by its small scale. One cannot but remark also that

THE LOUVRE

owes nothing to its details, which are, in fact, distressingly dreadful; but like the other two, it shows its depth. It does so by means of the projecting arcade, and also, and more especially, by the roofs of the pavilions. We all know that the French generally show the roofs of their public buildings, where we should probably keep them low and hide them with parapets, and there can be little doubt that it is one of the main secrets of their comparative success with such works; at any rate, the details can often have nothing to do with the matter; in many cases they are of the weakest and most contemptible description. The exhibition of the depth or third dimension, by merely exposing the return wall, is useless; the two walls still appear to be merely walls, as may be seen by referring to the Banqueting House and Sir Gilbert Scott's Government Offices. I mean no disrespect to the architects of these buildings, for their present appearance is no fault of the great men who designed them, since they are both unfinished. What is wanted to suggest solidity is something showing over and beyond the walls; in the Saluté it is the dome, in the Louvre the pavilion roofs, and in the Horse Guards the charming little turret that Fergusson sneers at. Most

MEDIAEVAL CHURCHES AND PUBLIC BUILDINGS

—Continental ones, at any rate—depend mainly on their big roofs for the purpose, which they fulfilled in a simple, natural, and adequate manner; and most modern French buildings, and a few English ones, follow their lead—cathedrals; Hôtel de Ville, Oudenarde; Rathhaus, Breslau; Rathhaus, Bremen; French town halls; Nottingham Municipal Buildings. But in England, even in mediæval times, notwithstanding there were the roofs, we liked to have also some solid structure rising from the middle of the composition and advertising the solidity of the edifice by its substantial appearance. And we have continued to prefer the expedient, where we have adopted any at all, to an exhibition of the roof, possibly from an undeveloped feeling that all roofs look unsubstantial. That it is the grander method there can be no doubt, and St. Paul's Cathedral, St. Albans Abbey, and the Brussels Law Courts testify that it is equally efficient. The Horse Guards might also be quoted, since the roofs of the centre block are practically hidden by the parapets. In this instance, however, solidity is partly obtained by another expedient, more common because more easily applicable in many cases, namely, by pavilions rising a story higher than the rest, and so showing their depth, but it is the turret that pulls the whole together and makes one mass of it. In these days

LARGE PUBLIC BUILDINGS

generally take the form of ranges of apartments surrounding one or more courtyards, and, so far as the periphery of actual building is concerned, solidity is sometimes, though not often, given by the higher pavilions just referred to. But it is now rare to find in England any attempt made to bring the whole together into one by a great feature rising behind the external range. Abroad it has been done in the Palais de Justice at Brussels, the new Parliament House in Berlin, and in many other cases. It might easily be done in our own Government Offices by building upon the intersection of the internal blocks, and in a vast number of cases it might be done simply by placing the eternally recurring tower, that we put in the middle of our main front or stick on to a corner, within the courtyard, or at any rate well back from the outside walls. Of course, the tower, as a tower, would lose, at any rate, its aggressiveness would be suppressed; but that is just what is often wanted for the sake of the modelling and

unity of the composition. To illustrate this point, I have ventured to cut up an illustration of a very fine competition design published some years ago, to show the effect of taking the tower from the position in which it was placed, and in which there were, no doubt, excellent reasons for placing it, and putting behind the buildings. Wherever

THE TOWER OR OTHER DOMINATING FEATURE

of the composition is placed, its proportion as seen from different points of view, might well receive more careful consideration than they often seem to get. If a tower is used, the main idea seems to be merely to run it up to an enormous height, and give it, as nearly as possible, the proportions of a factory chimney. There is frequently the same tendency to excessive height in the drum of a dome, while the flat square domes or roofs used in France and Germany are generally too low. Both the mass and proportions of the main feature whatever it is, should be regulated by those of the group to which it belongs; a low straggling building wants a high and narrow tower, a more concentrated composition, something broader and lower in proportion. If the area or plan of the feature has to be small for the edifice, it must be carried up high, or it will appear mean; if the opposite is the case, it can only be subordinated to the whole by keeping it low; if it is made lofty it overwhelms the rest, which must then be treated as subordinate. Such compositions as the church at the Saluté, before referred to, and the dome over the tomb of Napoleon are examples of the last arrangement, which is obviously the grandest when it can be adopted. To return to the question of the position of such a feature as a tower, balance requires that it should be somewhere near the centre of the composition. It is inevitably, and meant to be

THE CHIEF OBJECT THAT ATTRACTS THE EYE

and, if it is anywhere near the outside, still worse if it is at a corner, the group must be ill-balanced from most points of view. I remember Mr. Armitage, in his Royal Academy lectures on painting, pointing out that the main object of interest should never be near the margin of a picture unless the object were to suggest motion, as in the case of a ship just coming into view, and then the balance of the composition must be sacrificed. In Architecture we can never want to suggest motion, and cannot have that excuse. It is doubtful if the position should be the exact centre. The best painters and sculptors, though generally careful to put the chief point of interest near the middle of the composition, and to preserve a general balance between the opposite sides, always avoid the formality of a strict symmetry. There is something however, to be said for the view that architects may properly do otherwise especially in public works, and that such buildings should be symmetrically designed at any rate with reference to one main axis, the principal feature being upon that axis, and not far from the centre of it. For one thing, the formality which other artists avoid is really necessary to give that air of dignity and distinction to a great building which its character demands. It indicates organisation and order and balanced construction. Reviewing

SOME GREATEST PRODUCTIONS OF OUR ART,

we find that it is easy to note and appreciate the simple majesty of the Parthenon, the spaciousness of the Pantheon, the soaring vastness of St. Sophia, the richness of St. Mark's, the airy splendours of the great Gothic cathedrals and the exquisite lines of St. Paul's; but we cannot find any general arrangement common to all of them, except their symmetry with reference to a main axis, and are forced to the conclusion that, though many varying systems may be productive of the grandest results in skilful hands, yet symmetry is necessary to all of them. On the other hand it is noticeable that very few buildings of the first order are symmetrical with reference to more than the one axis, and that there is a certain tameness when it goes beyond that carried to excess, symmetry may easily take all the life and vigour out of a composition.

(To be continued.)

EVOLUTION OF STYLE IN ARCHITECTURE.*

By LESLIE OWER, F.R.I.B.A.

(Continued from page 500.)

OUR ideas of comfort and convenience have reached a high level, and buildings must be designed to satisfy those ideas in the first place, whatever may be the result on architectural design or proportion. Sanitation, which may be said practically to have begun with the Queen's reign, has also a distinct influence on Architecture. Buildings have to be planned so that the sanitary arrangements shall be in the most favourable positions for light and ventilation, instead of, as formerly, pushed into any dark and unventilated corners. Routes must be arranged for soil, waste, hot and cold water pipes, so that they shall work perfectly and be easy of access, but at the same time not obtrude themselves unduly on notice, combinations not always easy to attain. In the elevations these arrangements of planning make themselves apparent, requiring skill to work them in with the general design, and sometimes they develop into important features, as in the case of lavatory towers attached to the wards of infirmaries and hospitals.

BANEFUL INFLUENCES.

One of the baneful influences on the progress of Architecture, and an outcome partly of our commercial activity and partly of our climate, is the filthy condition of the atmosphere of our large towns from the amount of coal smoke belched forth from huge chimneys, and less evidently, though possibly not less obnoxiously, from the ordinary household fire. It is not encouraging, to say the least of it, to see a fine piece of Architecture become, in a year or two, sometimes almost before it is completed, so soot begrimed that it loses much of its effect. Surely engineers and scientists are not yet prepared to admit that everything has been tried, and that the cure of this great evil is beyond them. From every point of view, whether of beauty, sanitation, cleanliness, or comfort, it is desirable to have the nuisance abated. But meanwhile it is having its effect on Architecture, and, though baneful in one direction, has induced development in another. The desire for materials which will not absorb dirt has developed the industries of terra-cotta and faience, and much artistic work has been produced, especially in the latter. Speaking of smoke naturally suggests the subject of chimneys. In our climate the chimney is an important feature in architectural design, and has had considerable influence in modifying style. In the countries where the styles of Architecture were earliest developed the character of the climate rendered any special arrangements for heating or cooking unnecessary, and consequently those styles were perfected without consideration for this, to us, very necessary feature. This is only too apparent in the incongruous effect we often see when chimneys are introduced into classical designs. The makeshifts to conceal them or keep them subordinate, the attempt to keep them short, which generally results in an ugly regiment of tin pipes stayed by wires, and surmounted by whirligigs, all go to show that in buildings where chimneys are necessary the classical style must undergo some important modification before it will adapt itself to this new condition. It was not till the thirteenth century that the chimney took, in our country, the form of a flue built into or against the wall, but by the sixteenth century we find this feature fully developed, and the beautiful design and picturesque grouping of the chimney-shafts form one of the most piquant features of the elegant Elizabethan style, and stamp it with an undoubted national character. In any truly British national style the two leading features of Elizabethan Architecture, viz., the gables and the chimneys, must of necessity remain prominent. Another of the baneful influences on modern

Architecture is archæology. While having every admiration for the splendid piles which our ancestors raised, and which are amongst the proudest possessions of our land, I deprecate that slavish copying of their works which has been the fashion during the past Gothic Revival. To some men, and those high in the architectural Profession, the perfection of their Art has appeared to be the literal reproduction of some cathedral or church of the middle ages. The only effect which the contemplation of the great works of the past master-masons has been able to produce on such minds is craven self-abnegation, breeding poverty of ideas, and reducing the copyist to the miserable level of imitating even the faults and failings of his models. Instead of being inspired by the beauties of the mediæval treasure-houses, and wandering, Aladdin-like, in transport through their pillared naves and under their vaulted roofs, drinking in the spirit of their works, which in time would well up again and flow from his inspired pencil, rectified, refined, and transformed to the necessities of his age, the copyist—afraid of the responsibility of his own individuality—shelters himself in the shade of the centuries, like a child clinging to its mother's skirts. Such is the terrorism of the archæologist. You may have heard the story of Dr. Robertson's beadle. After the doctor was translated from the parish of Mains to Glasgow Cathedral, the beadle of the Mains Church called upon him. The doctor took him to the cathedral, thinking to hear Tammas break out in admiration of the fine building. But Tammas only remarked that "It had nae laft, and was sair fashed wi' thae pillars." There was an important hint for architects in Tammas's criticism. In designing a building, an architect should take care that it is, firstly, made suitable for its purpose; and secondly, that any decoration it may have shall not be of such a character as to impair its usefulness. Now it is undeniable that pillars are a great "fash" to a modern church, and it is equally undeniable that in these days of iron they are wholly unnecessary. The widest church can easily be roofed without their aid. The main feature of our church service, more especially of the Presbyterian Church, is the sermon, and it is highly desirable that all the congregations shall see and hear the preacher. In the old cathedral it was not so; the service was more of a ritual, and the idea was that the ignorant mind of the worshipper should be impressed with awe by his surroundings, an effect which the solemn, massive building, with its forest of pillars, vaulted roof, sculpture, paintings, gorgeous vestments of the priests and solemn processions, was highly calculated to produce. Those pillars were no "fash" to the mediæval worshipper, or he would have had none of them, but as it was they suited both his worship and the means of construction within his reach, and therefore he adopted them, and with his lively fancy clustered them and carved them, until he made them things of beauty. I do not mean to say that a modern church should not be built with nave and aisles, but when it is so it should be of such size that the nave only is used for service, leaving the aisles for passages or as open spaces for grandeur of effect. As Mr. Waterhouse said in one of his Presidential addresses at the Royal Institute: "We may love and reverence the past as archæologists, but as architects let us not forget that archæology is the bane of living, progressive Architecture."

THE FUTURE OF ARCHITECTURE.

And now a word as to the future of Architecture in our own country. The thought has been expressed by many: Why is there no new style of Architecture invented? And they lament the inartistic spirit of our time, which seems to them to fall behind past ages in this respect. These people forget that no architectural style has ever been invented, but has been the slow growth of centuries—a growth, at the same time, nursed and modified by the ever changing manners and customs of men, by their religious beliefs and physical conditions. A little reflection will show that it is not to be expected, even in an age like ours.

unsurpassed for progress in science and invention, that either new materials or inventions will quickly work such a radical change in building design and construction as to create anything that could be called by the honoured name of a "Style." The world moves slowly in such matters, and it may even be that, all unknown to ourselves, as it has always been to those who were the busy agents in producing it, a style may be developing under our hands and eyes which, in the estimation of those to whom we may be as ancients, will be fit to take rank alongside the great architectural styles of the world. Though we, like children on the seashore watching the rising tide, may think that the recoil of the wave is evidence that the tide of Architecture is ebbing, we may be sure that, when viewed in the broad light of centuries, it will be found that the tide was ever advancing, and that our age has also contributed its quota to real and lasting architectural progress. We have greater scope than any ancient nation ever had for architectural development, and greater wealth wherewith to build. While their opportunities were mostly limited to temples, palaces, and tombs, we have many other buildings demanding the greatest efforts of architectural genius, such as universities, asylums, hospitals, law courts, municipal buildings, exchanges, and the like. What the British style may be like when it has arrived at its perfection—whether it will be akin to Renaissance, Gothic, or Classic; whether the chief material will be stone, or brick, or iron, or concrete, or some new thing undreamt of in our philosophy—it would be idle to speculate. Meantime, let us, with unprejudiced minds and honesty of purpose, strive to satisfy the wants and aspirations of the age we live in, using judiciously but fearlessly the new inventions, materials, and opportunities which our scientific age and powerfulation have so abundantly provided for us, designing with Beauty, and building with Truth, assured that thus, and thus only, will we worthily fulfil our part in the creation of a National Style of that great and noble Art which we all so much love and admire.

THE residence in Kennington, formerly occupied by the Bishop of Rochester, is to form the site of a new theatre.

THE Holborn Board of Works has placed a newspaper kiosk near the Royal Music Hall, in Holborn; another at the end of Shaftesbury Avenue, and a third at the corner of High Street and Oxford Street.

THE question of the extension of the Dundee Central Baths, and the providing of a separate entrance for females, is being considered by the Markets and Baths Committee of Dundee Town Council. The cost of carrying out the work would be about £7000. The engineer has been instructed to prepare and submit plans, sections, and tenders for approval.

A SCAFFOLD accident happened last week at the new Roman Catholic Cathedral in Ashley Gardens, Westminster, now in course of erection. The scaffold gave way suddenly, and several men were injured. The accident happened while the four men in the hospital were on a scaffold in the interior of the building round one of the piers, 15ft. from the ground.

A BILL to incorporate a company for the purpose of constructing a railway from Windsor to Ascot has been deposited at the Private Bill Office. The proposed railway, which will be just over ten miles in length, is intended to commence by a junction with the Windsor branch of the Great Western Railway, and to terminate at Sunninghill by a junction with the Ascot and Aldershot branch of the South-Western Railway Company.

THE Estate Committee of the Town Council of the Pembroke Dock Ward of the borough of Pembroke have had under consideration the question of building a new town hall, with municipal and other offices attached, at Pembroke Dock. It was resolved to recommend the Town Council to provide a new town hall, with county court, post-office, &c., attached, and that steps be taken to acquire a site.

* A paper recently read before the Edinburgh Architectural Association.

Professional Items.

ABERYSTWYTH.—The contract for the proposed new County School has been signed. The price is £3195. The new school is to be finished within twelve months under a penalty of £25 per week. The contractors are Messrs. Belham and Co.

AYR.—Steps are being taken towards securing a site for the Ayr Town Hall. The previous building, which was burned some time ago, was, so far as internal appearance went, one of the finest in the West of Scotland, but unfortunately it was also one of the draughtiest. The hall had the disadvantage of not being on the ground and of having too few exits. The old hall was estimated to accommodate 1500 persons, and a structure calculated to hold 2000 or 2500 would suffice for the next twenty or thirty years. One of the proposals on foot is to buy a considerable quantity of property fronting High Street and adjacent to the old hall, and thereby have the public offices and public buildings together. The other site which finds favour is at the head of Sandgate, and there being only a few hundred yards between the two it is as central, and the cost of the property which would have to be acquired would be considerably less.

BARNSELY.—Mr. J. H. Taylor, borough surveyor, has issued his return of plans passed and buildings erected in Barnsley in the past year and since 1880. It shows that last year 96 sets of plans were deposited for 263 buildings, of which 199 were houses, five shops, two public buildings, 12 workshops, and 45 alterations; and 263 buildings were erected, of which 206 were houses, seven shops, four public buildings, seven workshops, and 39 alterations and additions. In 1896 the number of buildings proposed was 409, and buildings erected, 348; in 1895, 428 were proposed, and 231 erected; in 1894, 340 proposed, and 214 erected. The return shows that building has gone on in Barnsley since 1890 at a much greater rate than ever before. The population of the borough in 1891 was 35,427. Since then 1348 houses have been built and certified.

BIRMINGHAM.—The present year will see further changes in connection with the reconstruction of property in the centre of Birmingham. The new arcade scheme will clear away the Old Library building, and a number of queer old back premises between Union Passage and High Street, which now cover ground that has attained a greatly enhanced value. The leases have recently fallen in of the properties in Temple Row, between the Conservative Club and Cherry Street, while the leases are also expiring of the property on the south-west side of Cherry Street, between Temple Row and the City of Birmingham Bank. The Temple Row property includes the two old professional residences matching in architectural style those nearer to the Royal Hotel. The site comprises about 500 square yards, of which a new ninety-nine years lease has been taken by Mr. Moore-Bayley, who proposes to erect an important corner building which will accord with the Architecture of the Conservative Club and the new block, now in course of construction, between the club and Needless Alley. The lower portion will be suitable for the offices of a public company, while the upper floors will be planned as professional chambers. In connection with this reconstruction, and also of the adjacent buildings in Cherry Street, a proposal has been made to the municipal authorities for the widening of the thoroughfare, which, at present, is one of the most congested in the city. The roadway at the present time is only of sufficient width to accommodate two vehicles, and blocks are of frequent occurrence.

BRISTOL.—The Bristol Corporation Finance Committee have interviewed several candidates for the post of city estate surveyor and valuer, the salary of which is £700, rising to £1000, a year. Their choice fell upon Mr. Peter Addie, manager of the Birmingham

Corporation Improvement Scheme. Mr. Addie, who was formerly in the employ of the Swansea Corporation, went to Birmingham about two years ago, in succession to Mr. A. Davis, who was appointed agent of the Calthorpe estate. His salary was £300 per annum, and it was increased to £350 at a meeting of the City Council in December last, on the recommendation of the Improvement Committee.

CLAUGHTON.—The new St. Michael's Church has just been consecrated. At present it consists of a chancel, transept, and one portion of the nave, and will accommodate from 400 to 500 persons. When the architect's design is completed the nave will be still further extended to the west, and the church will seat nearly 800 persons. The architects were Messrs. F. and G. Holme, Crosshall Street, Liverpool, and the contractor, Mr. William Hall, 60, Christian Street, Liverpool.

COVENTRY.—During the whole of last year the building trade in Coventry was very active, although it did not reach the unprecedented dimensions of 1896, when nearly the whole of the cycle firms doubled the size of their factories to an approximate value of £102,320. The total value of the property erected in 1896 was £207,248, compared with £79,357 in 1895. During the past twelve months the number of houses finished, in regard to which certificates of occupation were granted, was 350, as compared with 171 in 1896, 129 in 1895, 200 in 1894, 193 in 1893, and 117 in 1892. At the present time quite a number of large building schemes are in progress. Foleshill has also rapidly developed, new industries having settled there.

DEWSBURY.—The Trinity Congregational Church has been reopened, alterations and extensions, costing about £3000, having been carried out under the superintendence and in accordance with the designs of Mr. A. H. Kirk, of Dewsbury.

ILKESTON.—New Board schools have been erected in Gladstone Street, Ilkeston. The schools are constructed upon the central hall system, with separate class-rooms for each standard or class of children, to accommodate 900 children. They are built in two blocks of buildings, viz., the boys' school and girls' school forming a separate block to accommodate 600 children, being 300 boys and 300 girls; and the infants' school forming a separate block to accommodate 300 infants. Each school has cloak-rooms and teachers' rooms, and is approached by separate entrance lobbies into each central hall, and leading from the central hall of each school are six class-rooms for each school. The central hall to the boys' and girls' school is divided by a revolving partition, keeping the boys and girls distinctly separate during school hours, and, when requisite, the revolving partition can be raised, to form a convenient hall for entertainments, &c., the dimensions being 101ft. by 24ft. The infants' central hall is 48ft. long by 24ft. wide. A cookery school is also provided, with entrance lobby, pantry, and scullery, and forms a detached building for use during school hours, and also for evening cookery classes. Separate lavatories are erected for each school, and there are covered playgrounds. The whole of the buildings are constructed of red Leicestershire bricks, and the roofs are covered with Broseley tiles; the interior floors being covered with solid wood block floors laid upon concrete. All the internal walls of the central halls, class-rooms, and cloak-rooms have a white glazed brick dado 4ft. high, the face of the walls above the dado being of plaster stucco face. The central halls, class-rooms, and cloak-rooms to each school are heated by hot-water circulating pipes, a separate heating chamber with coalhouse being provided for each block. The total cost of the erection of the schools was £9945, exclusive of the site and the furniture. The architect was Mr. Charles W. Hunt, and the contractor Mr. W. E. Shaw.

LEICESTER.—The buildings erected in Leicester during recent years indicate the transition from a struggling manufacturing town to a prosperous industrial community. During the year 1897 the building progress has been sustained. The Established Church has commenced and partially completed a church at Knighton Fields and another at New Evington. The Wesleyan Methodists have opened Wesley Hall on the Mere Road, a commodious building, in style a modern adaption of the Renaissance in brick and stone; also the Mantle Memorial Hall in Belgrave Gate, with an attractive elevation in terra-cotta. Adjoining this is a large hall, in course of erection, to meet the demand already felt for increased accommodation. The Baptists have opened Carey Hall in Catherine Street. Though plain and economical in design, it is well planned. The building of a Synagogue in Highfield Street has also been commenced. The Technical Schools in the Newark form an imposing pile of public buildings. The Belgrave district has been provided with public baths and a free library, which, though plainly treated, exhibit simplicity and refinement of taste in design. Messrs. Faire Brothers' warehouse in Rutland Street is Leicester's architectural achievement for the year. The two elevations are built in terra-cotta, designed in free Renaissance style. The doorway at the corner, with the clock over, surmounted by copper dome, makes a very effective piece of corner Architecture. Generally, the lower stone is plain, the richness of decoration increasing to the summit. Messrs. Pearson and Bennion are completing large engineering works on the Belgrave Road. This marks a very great advance in factory building. Quite a considerable number of smaller factories and extensions of existing ones have taken place during the year.

LIVERPOOL.—The alterations to be carried out in the interior of the Town Hall during March and April are calculated to greatly improve the appearance of many portions of the building. The stone slabs with which the corridors on the ground floor are laid are to be replaced with artistic mosaic work, in keeping with that in the vestibule, and the skirting boards are to be renewed with mahogany. The principal improvements, however, will consist of the provision of a number of retiring rooms, together with a gentlemen's smoke-room, &c., the latter of which will be placed underneath the crypt, near to the Council Chamber.

The Liverpool China and India Tea Company has erected a new café at 37, Castle Street, comprising a spacious suite of rooms on three landings. The rooms are designed in copy of Eastern divans, and are highly artistic. The ground floor is divided into two parts. The entrance hall is in the Renaissance style, consisting of wall fittings, &c., in Chippendale mahogany of beautiful design. The walls are hung with embossed leather in copper and gold, designed by Mr. Aston Webb, and the upper portion of the walls and ceiling, including the staircase to the mezzanine floor, and papered with wall hangings designed by Mr. G. H. Morton, jun. Passing through a mahogany screen, the ground floor café is entered, and this is treated in striking contrast, its delicate beauty of ivory enamelled woodwork consisting of a series of nooks arranged to accommodate two or four persons each. The style chosen is that ornament of the eighteenth century, or "Adams" period. The walls are panelled with a rich damask design in tones of tomato red, and the arched screens draped in rich gold-colour silk curtains, the larger arches being in tomato red velvet. Each nook is provided with settees upholstered in green frieze velvet and chairs *en suite*, a portion being reserved for ladies only. The first floor, or mezzanine, is treated after the manner of an Oriental divan or smoking-room. The colour decorations are of rich description, and the fretted wood screens and alcoves are of unique design, and have all the appearance of old work. The walls are decorated by Moresque arcing, the panels formed being decorated in glowing crimson tones, and the large spandrels elaborately treated in Eastern

colours and gold. The general effect of the arcaiding is continued in the wood screens, forming alcoves, each arranged to accommodate four persons. Divan seats are provided, and the introduction of Turkish rugs in harmonious colours completes a very perfect whole. The basement smoking-room is the largest portion of the café, and is decorated in modern æsthetic design. The room is divided by fretted dark oak screens of elaborate description. The whole of the works have been designed and carried out by Messrs. G. H. Morton and Son, 79, Bold Street, Liverpool.

NEWCASTLE.—The memorial stone has been laid of Erskine Presbyterian Church, Rye Hill, Newcastle. The new church, which is to be erected on the old site in Rye Hill, from designs and under the superintendence of Messrs. Badenoch and Bruce, architects, will accommodate fully 500, an increase of nearly 200 over the old building. It is designed in late Gothic; the walls will be of rubble, faced on the west or Rye Hill front by sneaked rock facing and chiselled stone dressings. Two large entrance porches are placed projecting into the open ground in front, giving access to vestibules and staircases leading to galleries which run round three sides of the church. The roof is constructed with hammer-beam trusses in pitch pine, with cleaved ceilings following the line of rafters and collars, and divided into panels with planted mouldings. The existing schoolroom in the basement is not to be interfered with, but the front portion under the vestibules will be converted into a ladies' room and tea-room, with wide vestibule and entrance lobby, lavatories, &c. The whole scheme includes a hall, seated for about 150, on the vacant site to the north of the church, with minister's vestry, both being on the same level as the ground floor of church; and on the basement level there will be infants' classroom, session room, heating chamber, and lavatories. The present contract is for the church only, Mr. Robert Veitch, of Barrack Road, being the contractor. The heating will be by low pressure hot water pipes and radiators. The ventilation is by Cousland and Mackay's "Climax" roof ventilators, with Sherringham air inlets, and the electric light is to be introduced throughout.

STONEHAVEN (SCOTLAND).—The new addition to St. James' Episcopal School has been opened. The addition consists of two classrooms, fitted up with all the most improved school furnishings, a teachers' room, and lavatories. The architect was Mr. J. A. Souttar, Aberdeen; Messrs. Smith and Co., Stonehaven, carrying through the mason work; and Messrs. R. Mitchell and Sons, Stonehaven, the joinery work.

STALYBRIDGE.—The extension of Castle Hall Church, which was taken in hand by the parishioners in May, 1896, in connection with the parochial jubilee, at a total cost of £2000, has been provided with a new parochial vestry, a side chapel, an organ chamber, and various alterations which add 130 sittings to the church. The chancel has been tiled, and new windows of cathedral glass placed throughout the edifice. The organ has been rebuilt by Messrs. Alexander Young and Co.

STRATFORD-ON-AVON.—The work of restoring the parish church of Stratford-on-Avon has recommenced. The work includes the removal of the pews from the nave, preparatory to the relaying of the floor, and the provision of a more complete system of heating. The contractors for the work in the nave are Messrs. Smith and Son, of Milverton, and for the heating apparatus Mr. John Grundy, of Manchester and London, the architect for the whole scheme of restoration being Mr. G. F. Bodley, A.R.A.

YEovil.—Carved figures representing the four Evangelists (Matthew, Mark, Luke, and John) have been erected within the recesses above the Holy Table in St. John's Church. The figures are of Beer stone. Mr. J. Nicholson Johnston, of Yeovil, was the architect, and Messrs. Harry Hems and Son, sculptors, of Exeter, executed the work.

Views and Reviews.

EXETER: THE CATHEDRAL AND SEE.

That the need existed for well-written, well-illustrated handbooks on our English cathedrals is beyond dispute; that that need is being well and truly met by Messrs. George Bell and Sons' "Cathedral Series" is, we think, equally indisputable. The aim of each writer in producing this interesting series, we are told, is to bring forth "a work compiled with sufficient knowledge and scholarship to be of value to the student of archaeology and history, and yet not too technical in language for the use of an ordinary visitor or tourist." It is in the admirable way in which this object has been fulfilled that the great merit of the series lies. There is a compact fullness and scholarly touch in these records of the history and beauty of England's noblest shrines which, with a wealth of illustration, render them superior to the local guide-book, whilst they are more portable than the elaborate monographs dealing with some of our cathedrals. And what applies to the series generally, applies to the number of it before us, "Exeter: The Cathedral and See." It is by Mr. Percy Addleshaw, B.A., who has made a worthy contribution to the literature already existing on the subject of Exeter and the cathedral there.

Exeter: The Cathedral and See. By Percy Addleshaw, B.A. Published by Messrs. G. Bell & Sons. Price 3s. 6d.

ENGLISH CHURCH ARCHITECTURE.

Doubtless there is a vacancy at the present time for a simple, clear, well-illustrated treatise upon English Gothic Architecture. The existing works were, almost without exception, written in the early days of the Gothic revival, a full generation ago, and naturally we know more now than the writers did, while what satisfied our predecessors in the way of illustrations—what under their circumstances were really wonderful productions—would scarcely be looked at now. Draughtsmanship has risen to a pitch of perfection of which they scarcely dreamed, the camera has come into universal use for illustrative purposes, and the methods of reproducing drawings have been entirely revolutionised. But a book which is inconsequential, which is devoid of much originality or thoughtfulness, and which is illustrated only by a series of more or less scratchy sketches, cannot be said to meet fully the requirements. Such is the book before us. Its second chapter may almost be taken as a fair sample of the whole. It is entitled "The Crypt," and the first paragraph is devoted to that subject; but the rest—there is not much of it, fortunately—is given up to a series of wandering remarks upon shrines and relics.

"Progress of Art in English Church Architecture." By T. S. Robertson. Published by Gay and Bird, 32, Bedford Street, Strand. Price 5s. Small 8vo.

THE Japanese Government, which has just ordered to be commenced the work upon the new harbour at Osaka, at a cost of 30,000,000 yen, has now decided to inaugurate a similar enterprise at Nagasaki.

A NEW development of the work of the Battersea Polytechnic has been made by the opening of a technical day school. The school has been formed to give special instruction to young apprentices and to lads leaving the elementary schools who are desirous of entering the building, mechanical, or electrical engineering trades.

SIR LEADER WILLIAMS and Thomas Meek and Sons, engineers to the Workington Corporation, have furnished the estimate of the cost of the new dock and railways at Workington, which shows a total of £349,417, the pier being £19,400, breakwater £22,600, entrance channel £26,700, wet dock £213,000, and railways £67,600.

THE Board of Control has received tenders, on plans and specifications prepared by Mr. Cowan, C.E., for certain extensive works to be executed in connection with County Down Asylum, and Mr. Coulter, builder, Newtownards, has been appointed contractor at £10,608 14s.

Correspondence.

"ECCLESIASTICAL DOORWAYS IN CORNWALL."

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I have read with interest Mr. Edward Sedding's account of the ecclesiastical doorways found in Cornwall. With regard to Mylor Church, near Falmouth, I was the leading hand during its restoration, under the late Rev. J. McMurray, the vicar and architect of the restoration. Mr. Sedding states there were only three churches in Cornwall with frescoes, Fowey and Lostwithel being included. I wish to say that before the restoration of Mylor there existed some fresco paintings, but owing to the rottenness of the old plastering it was found impossible to preserve them, and an artist sketched the same with many other points of interest, viz., the old Norman doorway and an ancient cross or stone crucifix, parts of another Norman doorway found in rebuilding the north wall of the church; these parts, with new additions, form a doorway at the west end of the church. These, with a figure in fresco painting, found some few years previous to the restoration of Mylor at Lanivet, near Bodmin, were put in pamphlet form with the above mentioned illustrations. —I remain, Yours obediently,

JAMES H. HARRIS.

THE REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—If I mistake not, there is a very gloomy future in store for architects unless some great move be made in the direction of registration. At present we have no fully recognised authority whatever in the Profession, no power to stop or even check the evils that have gone on festering for years, no organisation to provide for us such useful helps as wire codes, vocabulary of authorised abbreviations, and short, comprehensive terms, colour definitions, art standards, railway facilities, patent tests and records, &c.

In the old days when, with a few exceptions, a man's work lay chiefly in his own district, the clumsy machinery we still have worked tolerably well, but now that we are forced to travel far and wide, some improvements in routine are urgently needed. If I may presume to advise the younger men, I should say, agitate for the formation of a great building guild, imperial rather than insular, comprehensive, and therefore powerful. Include every architect and all assistants; enrol the builders, as they will give it a practical character; invite artists, sculptors, &c., to join, as they will give it artistic tone.

Such a guild as this would slowly but surely give us the reforms so long needed, which I need not mention. I venture to think one good result may be looked for—the annual criticism of the Guild Council would act somewhat as the governor upon an engine—the more work a man grasped at, the better he would be expected to do it, instead of the reverse, as at present.

Perhaps a few so-called "successful men" who are suspected of running their offices as money-making affairs would shrink from such a guild, but they must remember that architects are made for Architecture, not Architecture for architects.—I am, yours faithfully,

WILLIAM LUNN.

Great Malvern, Jan. 8, 1898.

MR. Edison announces that he has made a new discovery of great importance, of a metal which, when mixed in certain proportions with smelted iron, renders cast-iron as tough as the same metal when wrought.

STUART and REVETT, who travelled in Greece last century, sketched a small Ionic temple on the left bank of the Ilissus, near the fountain of Kallirrhoe, which has disappeared since then. Skias, however, has recently discovered its foundations about a hundred paces from the celebrated spring. Herr Dörpfeld regards it as the temple of Artemis Agrotera, mentioned by Pausanias.

Trade and Craft.

RE THE SMOKELESS FIRE COMPANY.

Mr. Ernest E. Pither informs us that, "having purchased the whole of the patent rights, stock-in-trade, goodwill, and patterns of the Smokeless Fire Company (in liquidation), we are transferring the business, for the time being, from 100, Shaftesbury Avenue, to the Central Depot of the 'Radiant' Stove, 36, Mortimer Street, W. Mr. E. P. Milne, heating engineer and expert, will continue his management, and give personal attention to all enquiries and orders, and, assisted by an able staff of fitters, &c., carry out all work."

A MUCH-SUMMONED BUILDER.

At the West London Police-court Mr. Rose disposed of a batch of 105 summonses against Mr. Joseph Wilson, a builder, issued at the instance of the London County Council, with reference to the erection of twenty-one houses in Stephendale Road, Tounmead Road, Fulham. The cases were formally opened some time ago, and had since been standing over for an arrangement. The complaint against the defendant was that he had used in the erection of the houses bad mortar and bricks, and had been guilty of other offences under the Building Act.—Mr. Seager Berry, who represented the Council, said the defendant had carried out remedial works, and was doing all he could loyally to complete them. He (Mr. Berry) left the matter in the hands of the magistrate to fix the penalties and costs.—Mr. Macmorran, Q.C., for the defendant, agreed to the arrangement, but mentioned that the remedial works had cost him £1000, which was rather hard upon him, as the houses were erected under the supervision of the district surveyor.—Mr. Rose then fixed nominal penalties in each group of summonses, amounting in the whole to £4 4s., with 18 guineas costs.

THE FREE LABOUR PROTECTION ASSOCIATION.

The Free Labour Protection Association, which was formed in July last, and has its central offices at 7, Victoria Street, Westminster, has published a report of its proceedings to the end of 1897. Since its formation the Association has added to its original statement of objects the following: "To give such help to employers during strikes as may seem best calculated to further the aims of the Association, and upon such conditions as the Executive Committee may determine." Action has been taken in regard to, among other strikes, the Blackburn builders. Among the men engaged by the Association to take the places of unionist workmen on strike at Blackburn were some Dutch carpenters and joiners from Amsterdam. Owing to the successful importation of non-unionist labour in Blackburn, the strike, so far as its effects upon the master builders are concerned, is now ended. The committee of the Association desire to make it perfectly clear that the operations of the Association are not directed against trade unionism as such, but only against such abuses of trade unionism as interference with free labour and attempts to coerce employers in the management of their business—two evils which, in the interests of employers and employed alike, should be firmly repressed. The membership of the Association is claimed to be "nationally representative," and includes all the leading quarry owners, iron and steel manufacturers, and the engineering employers, as well as the master builders, and representatives of many other trade interests.

The St. Pancras Vestry has resolved to replace Euston Road from Gower Street to Seymour Street, and that hard Australian wood should be used in lieu of granite setts, the estimated cost being £4828.

RECENTLY two cottages in Waggon Road, Wincham, near Northwich, collapsed. The dwellings were part of a ruined block of six which were abandoned. Owing to the subsidence of the ground beneath the whole were bolted together, but, despite this, the two end buildings fell away.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERDEEN.—Accepted for taking down and re-building walls, Berryden-road, for the Town Council. Mr. Wm. Dyack, Borough Surveyor, Town House, Aberdeen:—
Gall and Walker, 45, Richmond-street, Aberdeen £985

ASHTON-UNDER-LYNE.—Restoring Fern Mill, Ryecroft, after fire. J. H. Burton, architect, 2, Guide-lane, Hooley-hill.
E. Pike, Hooley-hill £190 0
E. Marshall, Ashton-under-Lyne 115 0
J. Riddard, Ashton-under-Lyne 112 0
John Robinson, Ashton-under-Lyne (accepted) 112 0

BROMLEY (Kent).—For the erection of new premises for Martin's Bank, Limited, and shop for Mr. R. Taylor. Mr. Ernest Newton, architect:—
Martin's Bank. Shop Premises.

R. A. Lowe	£4,040	£3,120
Armand and Son	3,962	3,117
Colls and Son	3,986	3,069
Crossley and Son	3,900	3,000
D. Payne	3,900	2,991
T. D. Grady	3,855	2,995
Patman and Fotheringham	3,821	2,963
Maid and Harper	3,759	2,975
F. P. Duthoit (Bromley)	3,667	2,797*

* Accepted.

BRIDLINGTON.—For the erection of dwelling-house, stable, &c., Carlton-street. Mr. J. Smith:—
James Walker £490 J. Sawdon £357
W. Barnes 378

BUSHEY LEATH.—For alterations and additions to Powis Lodge, Bushey Heath. Messrs. Higgs and Rudkin, architects, 25, John-street, Bedford-row. Quantities by Mr. Alan Paul, 6, Quality-court, Chancery-lane.
Parfit and Co. £1,534 J. Smith and Sons £1,289
H. Wall and Co. 1,325 Henry Line 1,289
Wm. Bailey 1,295 Wm. Wade (accepted) 1,187

CARDIFF.—For alterations and additions, 290, Bute-street, Cardiff, for Mr. J. Lewis. Messrs. Habershon and Fawcner, architects. Quantities supplied:—
J. Beer and Sons £483 0 0 G. Haywood £450 0 0
C. Eric and Sons 479 10 A. J. Howell & Co. 415 13 10
Shepton and Son 458 10 0 Melhuish Bros.* 415 0 0
Knox and Wills 455 0 0 * Accepted.

HUDDERSFIELD.—For the erection of seven houses, Moor-lane, Netherton. Mr. J. Berry, architect, 9, Queen-street, Huddersfield:—

Masonry.—W. Pearson and Son, New-street, Netherton	
Joinery.—E. Parkin, Netherton	
Plumbing.—J. Hebblethwaite, Road-side, Netherton	
Plastering.—E. Jessop, Netherton	£1,700
Painting.—W. Littlewood & Son, Netherton	
Slating.—Pickles Bros., Fountain-street, Huddersfield	
Concreting.—J. Cooke, Little Royd, Huddersfield	

KINGSTON-ON-THAMES.—Accepted for additions to the Royal County Theatre, for the Directors of the Kingston-on-Thames Theatre Co., Limited. Mr. J. Charles Bourne, architect, 62 and 63, Basinghall-street, E.C.:—
Kirk and Kirk, Westminster £295

LONDON.—For additions to stables and repairs, High-street, Kensington, for Messrs. Rickett Smith & Co. Messrs. Potts, Son, and Hennings, architects:—
E. Green £374 Mattock Bros.* £284
W. Gladding 348 * Accepted.

LONDON.—For rebuilding the "King's Arms" public-house and shop adjoining, being Nos. 11 and 9, Little James-street, W.C., for Mr. Charles L. Soullard. Messrs. Thurgood and Martin, architects. Quantities by Messrs. Franklin and Andrews:—
Laing and Son £3,367 J. Greenwood £2,869
Prestage and Co. 3,179 Goff and Co. 2,851
Bywaters 2,943 T. Sobey 2,784
F. Bollar 2,930 T. W. Rhodes 2,650

LONDON.—For works required for pulling down and rebuilding the "Elephant and Castle" Tavern, Newington Causeway, for Mr. A. Meek. Mr. John Farrer, architect and surveyor, Albion-chambers, 23, Finsbury-pavement, E.C. Quantities by architect:—
Higgs and Hill £41,840 Mattock Bros. £28,940
W. Cubitt and Co. 40,783 Patman and Fotheringham 38,910
B. E. Nightingale 39,975 Lascelles and Co. 38,850

* Accepted.

LONDON.—For adapting for a temporary school, Mission-hall, Old Ford-road, E., for the London School Board. Mr. T. J. Bailey, architect:—

A. E. Symes	£149 0	D. Gibb and Co.	£133 0
G. Barker	140 0	J. T. Robey	130 0
J. Kybett	135 0	J. F. Holliday	129 10

* Accepted.

LONDON.—For altering boys' and girls' entrances at the Wilmot-street schools, for the London School Board. Mr. T. J. Bailey, architect:—

G. Wales	£115 7	Johnson and Co.	£92 10
Silk and Son	109 0	G. Barker (accepted)	81 0
Harrison & Spooner	93 0		

LONDONDERRY.—For the erection of house in the city. Messrs. R. H. M'Elwee & Co., architects, 9, Carlisle-road, Londonderry:—

A. Dunlop, Little James-street, Londonderry £134

MAIDSTONE.—For additions to the Council's offices for the Corporation. Mr. F. Bunting, Borough Surveyor:—
George Pearce £370 0 H. A. Thomas £283 10
W. T. Barrows 296 0 W. J. Logan, Maidstone (accepted) 255 0
Thompson and Chapman 293 15

MIDDLESBROUGH.—For the execution of street works, Kingston-street, for the Corporation. Mr. F. Baker, C.E., Municipal-buildings, Middlesbrough:—

Kingston-street.
Jones's Annealed Concrete Company £177 12 8
J. T. Dixon, Preston (accepted) 164 10 3

Samuelson-street.
Jones's Annealed Concrete Company, Middlesbrough (accepted) £64 13 9

MITCHAM.—For the erection of four pairs of cottages at Lower Green, Mitcham, for Mr. R. A. Bush. Messrs. R. M. Chart and Son, architects, Croydon:—
J. Burges £4,334 H. Bacon £4,059
Smith and Sons 4,119 H. Haydon 4,017

MITCHAM.—For the erection of a boiling-house at Western-road, Mitcham, for Messrs. Blume, varnish manufacturers. Messrs. R. M. Chart and Son, architects, Croydon:—
D. Waller £812 E. J. Burnand £751
J. Burges 785

PONTEFRAC.—For the execution of drainage works, 5,700 yards pipe sewers, &c., Glasshoughton, for the Rural District Council. Mr. Malcolm Paterson, C.E., 35, Manor-road, Bradford:—
F. Eyre £4,691 15 10 M. Hall and Son £4,316 13 1
W. and J. Foster 4,686 1 1 W. Binns 4,342 16 4
Geo. Bell 4,488 6 0 A. Braithwaite & Co., Leeds* 4,162 8 9
Jackson Bros. 4,450 0 0 Jno. Bentley 4,408 1 4

* Accepted.

PONTYPOOL.—Accepted for the erection of house near St. James's Church, for the Pontypool Wesleyan Methodist Circuit. Mr. D. Davies, architect, Springfield, Pontypool:—
Bailey Bros., Pontnewynydd, near Pontypool £660

[Including certain items found by the owners.]

PRESTATYN.—For the erection of superstructure of Royal Victoria Hotel, Prestatyn (Contract No. 2), for Mr. Martin O'Connor, Liverpool. Mr. Richard E. Hughes, architect. Quantities by Messrs. Humphries and Moore, 136, Corporation-street, Birmingham:—
Roger Bateson £9,765 0 0 Chas. Burt, Liverpool £9,018 19 5
W. O. Russell 9,276 0 0 E. Morton Hughes 8,871 0 0
W. S. Wood & Co. 9,690 0 0 Bradney & Lloyd 8,885 0 0

* Also carried out Contract No. 1 (foundations), amounting to £1038 12s. 2d.

PUNEY.—For the erection of a block of residential flats on the Pune Embankment. Quantities by Mr. George Stephenson. Messrs. Palgrave and Co., architects, 28, Victoria-street, S.W.:—
Allen and Sons £13,650 Patman & Fotheringham £12,798
Yerbury and Sons 13,489 ham
Chessum and Sons 13,364 Perry and Co. 12,313
Holloway Bros. 13,350

SOUTHAMPTON.—Accepted for the erection of five cottages at Shirley, for Mr. J. Hayward. Messrs. Jurd and Sanders, architects, Portland-street, Southampton:—
W. R. Taylor £900

TRIMDON (Durham).—For the erection of a board school, Trimdon Foundry. Mr. James Garry, architect, 27, Church-street, West Hartlepool:—
J. Howe and Co. £1,941 0 0 Watt Bros. £1,619 6 8
W. O. Russell 1,783 0 0 W. C. Atkinson & Co., Stockton-on-Tees 1,783 0 0
Curry 1,680 0 0 Tees (accepted) 1,619 0 0
Manners 1,670 0 0

WANSTEAD.—For the construction of 1,900ft. 9in. pipe sewer, &c., for the Urban District Council. Mr. John T. Bressey, surveyor:—
D. Brewer £730 Grounds and Newton £450
H. Williams 550 Jesse Jackson 444
W. Gibbs and Co. 545 J. Bell 415
H. Clarke 529 H. L. White 400
T. Adams 519 W. Swaker 400
Joseph Jackson 477 W. Manders 370
French Bros. 473 A. T. Catley, 23, Lloyd-square, W.C. (accepted) 360
J. Reeves 468

"EMPRESS" SMOKE CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney pot.

Surveying and Sanitary SUPPLEMENT.

JANUARY 19TH, 1898.

POLICE STATIONS AND PRISONS.

BY GEORGE H. BIBBY.

II.—SIZE OF CELLS.

(Continued from page xxxiv.)

THERE are many important points to be attended to in the construction of the cells with the view of ensuring the security of the prisoners and the prevention of communication between them. In the first place the external walls should not be less than two bricks thick, or 2ft. of stone,

have 9in. in thickness through concrete and brick arch at the crown, but the floor may be of Portland cement concrete of not less than 9in. throughout.

The division walls between the various cells should never be less than 14in. in thickness, so that no communication between the prisoners may be made. The windows of the cells are required to be fixtures, and may be glazed with rough plate, fluted, or ground glass, through which persons cannot be distinguished; they should be inaccessible from the outside to unauthorised persons, and should open towards a specially inclosed yard or space having no connection with other premises, while the cells should open off from a corridor separately arranged for males and females, except in the case of small police

keeping them in good working order and properly supplied and emptied). The floors must be of some suitable material, which can be readily washed, such as asphalt, &c. The above requirements are in accordance with the regulations of the Government in reference to such matters as are concerned with the erection of police stations, but with regard to prisons the Government have never issued instructions as to the details of their construction, and appear always to have built and altered these by the aid of their own officials.

In the accompanying Figs., and in those illustrating the opening part of this article, are shown different modes of cell construction and arrangements which have been approved and suggested by the authorities for the heating and ventilation of the same. It is required

LONGITUDINAL SECTION THROUGH CELL

TRANSVERSE SECTION
THROUGH CELL

FIG. 3.

and it has been suggested that considerable obstacles to breaking through the walls would be afforded by the introduction of courses of hoop-iron laid in the middle of the walls at intervals of 6in. apart. To guard against undermining, a brick arch should be turned in cement underneath the floor of the cell, cement concrete being filled into the spandrels and carried over the crown of the arch, so as to

stations. Opening out of these corridors or passages separate water-closets should be provided, but some of the cells may have water-closets in them (see plans). The water-closets for males and females must in any case be quite distinct, and dry-earth closets may be used instead of water-closets where there is a sufficient reason for doing so (and when proper arrangements can be made for

that fresh air should be admitted into the cells from the outside, through an inlet opening not less than 54in. in area, provided in the cell windows, a portion of which may be made to open; or that a ventilator be provided in the outer wall, but means must be provided to prevent any such openings, either in windows or ventilators, from being used for unauthorised communications between the prisoners.

DILAPIDATIONS.*

BY PROF. HENRY BUSHELL, F.S.I.

(Continued from page xxxv.)

THE lessee may elect either to execute the dilapidations or discharge his liability by payment of the claim; the latter plan probably is more satisfactory to both parties, certainly to the lessor, because it affords him a free hand, and supplies a favourable opportunity for executing any additional repairs, decorative work, or improvements. When the respective valuations are so divergent as to render a settlement impossible, it would invariably be prudent for a third surveyor or umpire to decide either the amount of claim or to settle the differences between them in the usual way. Builders' tenders for competition works, and compensation claims, backed up on both sides by experts of undoubted ability, are not the only calculations that afford a contrast of figures at once puzzling and amazing to a layman. Claims of dilapidations too often vary in the most inexplicable manner. I am of opinion that such divergences are brought about by the different views entertained by surveyors as to what are dilapidations, as well as what are their value. The learned judge, in the well-known case of *Gutteridge v. Munyard*, stated to the jury that "it would not perhaps be very fair to judge him (the lessee) very rigorously by the reports of a surveyor, who is sent upon the premises for the very purpose of finding fault." That may be a very proper remark, and I have already admitted that exaggerated notions in connection with dilapidations are by no means rare; but on the other hand, I most deferentially submit that it would be a dangerous precedent, and derogatory to the professional expert, if he is to be solely regarded as a mere advocate of a cause, submitting evidence he cannot substantiate. Without presuming to trespass on the subject of arbitrations, I may be permitted briefly to notice the advisability (under certain circumstances), of that mode of settlement of disputes concerning dilapidations and matters incidental thereto. In cases of this kind a reference to an arbitrator having a special experience in such matters would probably conduce to a speedier and more satisfactory settlement than by a trial by judge or jury. But, in either event, the surveyor representing the lessor and the lessee respectively, should, of course, be important witnesses. When such "disputes" are decided even by a skilled arbitrator of high position, the frequent result is that the award brings disappointment to at least one of the parties. In giving evidence as an expert witness, the surveyor acting for either party in a dilapidation case must be in a position to explain all general points affecting the practical side of

* A paper entitled "The Practical Application of the Principles and Law of Dilapidations," read before the Auctioneers' Institute.

FIG. 2B.

Amongst the officially approved means for the warming of the cells of police stations are the following: Warm air may be admitted into the cells from the corridor, in which a stove should be provided to warm the air, through inlets in the upper part of corridor walls; or by circulating hot water pipes laid in a channel under the corridor floor, with inlets to the cells either near the ceiling or 12in. from the floor; or by pipes laid in the cells just above the floor, enclosed by a casing to form a chamber, in which the air brought directly from outside the building is kept in contact with the hot water pipes, and then admitted into the cell through gratings. In each of these three arrangements fresh air from the outside should be admitted in sufficient quantity to supply all the cells, the inlets being equal to 54in. for each cell; the area of the clear openings in the gratings should be equal to that of the inlets, and care should be taken that the gratings are arranged to prevent them from being made means of communication. The inlet openings for fresh and warmed air into the cells should have as few bends as possible; they should be provided with means of regulation by the prisoner, but not be capable of being quite closed; foul air should be extracted from the cells by means of flues, having a superficial area of not less than 54in. per cell. These flues should be led to the outer air in as direct a course and with as few bends as possible, but may pass into a main horizontal trunk and vertical shaft, which should be equal in area to all the flues led into them. The shaft should not be less in height than two-thirds of the horizontal distance from it of the most distant cell ventilated into it, and it is desirable that means should be provided to rarify the air in the shaft to assist extraction, but if this be not practicable, some form of induced current ventilator at the outlet should be provided. The openings into the extraction flues should be as far as possible from the inlets for warmed air into the cells, and, therefore, when the warmed air is admitted to the cells through the inner wall and near the ceiling, the openings to the foul air flues should be near the floor, in the outer wall of the cells, and clear of the beds.

Amongst other official suggestions or requirements are the following: Artificial light should be provided for the cells accessible only from the cell corridor; each cell should be provided with a fixed wooden bench, about 30in. wide, to serve as a seat or a bed, and a bell or gong communicator to enable the prisoner to call attention if necessary; the

cell doors and frames should be lined with sheet-iron, and have glazed inspection holes, with drop or cover, on the corridor side, and a strong flush lock to open from the outside only; the doors may be hung to open outwards, but in that case two barrel bolts must be fixed in addition to the lock to give security; there may be a tap for cold water and a lavatory in the passage, or basins and water may be supplied to prisoners in their cells.

From the above it will be noted that the construction of so small an apartment as a cell 13ft. by 7ft. by 9ft. involves many points requiring careful consideration and arrangement, but the grouping of a number of cells, the position of corridors and passages and of the offices in connection therewith, will be the subject of another paper and further illustrations.

(To be continued.)

As a result of a visit of a deputation of the Hexham Urban District Council to the experimental plant laid down at Yeovil and Exeter in connection with the septic tank system of sewage disposal, it has been unanimously advised that the Hexham Town Surveyor be instructed to prepare plans and estimates, with a view to adopting the system of the Tyne Green outfall.

FIG. 3A. PLAN.

the action, and also to know, not only the original condition of the premises and the terms of the lease, but to have an intimate acquaintance with the covenants. Further, if acting for the lessor, the surveyor would do well to prove the *bona fide* nature of his claim; while on the other hand, if he be acting for the lessee, he should show the kind of maintenance, and to what extent, and in what manner the lessee has regarded and fulfilled the repairing covenants and similar obligations to the lessor. To further strengthen the lessee's case, his surveyor would do well to show the unquestionable validity of his valuation, the safeguard of a measured and detailed basis of pricing, the elimination of mere guess-work in making the valuation, the extent or non-existence of "sporting items," and possibly, as a further confirmatory proof,

A REPUTABLE BUILDER'S ESTIMATE, undertaking to execute in an approved manner the whole of the items included in the schedule. It is, of course, self-evident that to some extent a reference will be governed by the circumstances. For instance, if the scheduled dilapidations are admitted, then the arbitrator will have only to decide the amount; but if the divergence is considerable, as is not from various causes unlikely (for one surveyor may claim a dilapidation which the other absolutely repudiates), then he should decide on each separate matter in dispute. If any proof is needed of the importance to the qualified surveyor of what I have designated the practical side of this great subject, it is more than sufficiently established by the striking facts: first, that the Surveyors' Institution gives some prominence to dilapidations in its curriculum of examinations; secondly, that the Auctioneers' Institute exacts from its examinees a proficiency in this subject. The whole subject of dilapidations bristles with intricacies, and, unfortunate as it is, surveyors get little or no real practical help from legal decisions, except in the way of precedents, and even then it is often more or less bewildering for a layman to follow the ever-varying dicta of different learned judges, and the elaborations of able arguments in relation to questions which so immediately affect the

surveyor. The different degrees of repair, and many of the everyday expressions in dilapidations are examples, the true meaning of which never seem to be definitely settled. Then again, "dilapidations" from time immemorial have been more or less enveloped in obscurity, and considerable hardship has, in the past, been inflicted on tenants. The subject was formerly so remote as apparently to be little understood even by the highest tribunals. I should imagine that surveyors worked upon methods then which to-day would be considered clumsy and crude. In recent years there has evidently been a reform, and, although gradual, it has produced a more "equitable" relationship between lessor and lessee. Moreover, the subject now undoubtedly is better understood, which fact is in itself sufficient to be productive of better results. Too much care cannot be expended in either scheduling or assessing dilapidations. A summary mode of dealing with such has many disadvantages, and claims are often made in these days in such a hurried manner as not to be conducive to accuracy. There is occasionally a desire to extort from a lessee an unwarrantable amount for repairs, while, on the other hand, the same individual, or his surveyor, values at such a ludicrously small sum as to make negotiations exceedingly difficult. A case which came before my notice some few years ago affords an apt example of the first kind. A gentleman had a residence on lease, and the term having expired, the dilapidations were surveyed by the agents, who requested payment of a certain sum in satisfaction—I am not familiar with the terms of the lease, but I knew the house. The lessee, astonished at the claim, procured from a first-class builder an estimate undertaking to put the whole of the premises into thorough repair, inside and out, fit for a new tenant (which, I should imagine, represented something over and above the lessor's liability), and the estimate amounted to about one half of what the agents demanded! I ought to add that the firm of agents referred to are not members of the Auctioneers' Institute. Having now dealt at some length with the general principles of dilapidations and the position of the surveyor under different cir-

cumstances, I will at once approach another side of the subject, the importance of which, to the surveyor, cannot be over-estimated, and in so doing we shall be put into closer touch with the law in relation thereto. I refer to the surveyor's ever-present difficulty of determining the effect of certain covenants in leases which indicate the many different degrees or qualities of repair, such as "tenantable repair," "good tenantable repair," "substantial repair," "habitable repair," and such other familiar phraseology (always present in leases) as "uphold," "support," "sustain," "maintain," "amend," "keep," &c.; not undervaluing the importance of the expressions, "wear and tear," "reasonable wear and tear," "use and wear," "sufficiently," "reasonably-minded tenant," and numerous other distinctions. I think that

"TENANTABLE REPAIR" is amply illustrated by one of the most important dilapidation cases of recent times, viz., *Crawford v. Newton*, tried in the year 1886. Briefly the facts are as follows:—Under an agreement for a lease for five years of a dwelling-house called *Burley House*, near *Leeds*, the tenant was to leave the house in tenantable repair. In an action for damages by the landlord at the end of the tenancy (which continued for seventeen years) upon the footing that the tenant was liable to paper and paint, and leave the house in the same condition as when he took it, it was held by Mr. Justice Cave that the landlord was not entitled to compensation for waste, the tenant being liable to paint sufficiently to preserve the woodwork, but not to do papering or decorative painting. The plaintiffs delivered particulars, and claimed upwards of £300. In giving judgment the learned judge concluded an able and lengthy review of the case in these words: "Looking to the fact that the plaintiffs claim a sum of over £300, and they have established their right to only £20, and as to that, half is not to be found in the particulars at all, I think the proper course is to give my judgment for the plaintiff for £20, without costs." The plaintiffs appealed, but the appeal (heard before Lord Esher, Master of the Rolls, and Justices Bowen and Fry) was dismissed. (To be continued.)

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—				
J. H.	22	Bideford—Construction of Market	Council	R. T. Hookway, Architect, Bridgeland-street, Bideford.

S. K. M. and Ministerial Mishaps.

S. K. M. and Ministerial Mishaps. THE TIMES is the elephant of the Daily Press Zoo, and an elephant must be solemn and judicial in all things, or his attractions will gravely diminish, and he may even cease to pass as an elephant at all. Mindful of its conspicuousness by merits of size and dead-weight, The Times undertakes in an oracular leader, in a recent issue, to direct and

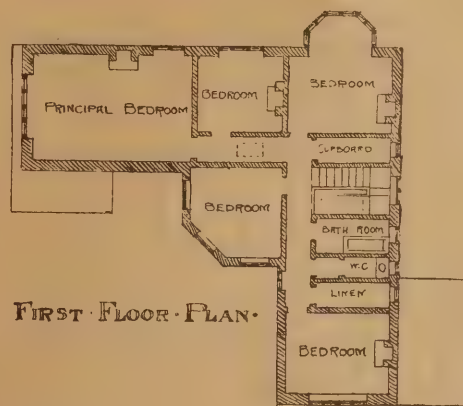

will remember the museum is an educational storehouse; and 'concludes' by telling the public and the Government what they want; and it seems what they want is, "not a fine building which will cost a fine sum, but a plain tasteful building, well arranged for the purpose for which it is intended."

A worthy building could be raised for much less than £400,000." To this one may reply with confidence that the whole of the professions of the Arts and Crafts, and all amateurs and those contingents of the public which are accustomed to give an appreciative consideration to the subject of Architecture, or who desire to see the national prestige and prosperity adequately expressed in the Architecture of national institutions, all and each pray and hope that the Office of Works will do its utmost to *forget* that the National Museum of Art is merely an educational storehouse; and (inasmuch as £400,000 was originally named as a fit and becoming price to pay for a building of such importance) that Treasury Authority for the expenditure of £400,000 will be granted. From the tone of *The Times'* leader it would seem as though the writer

guaranteed that the considerations of plan lighting, heating, ventilation, and the other practical needs that must be satisfied in a good museum, would find first attention from the competitors, as being first recommendation to the assessor; and that the cost of £400,000 was the conceded price which the various competitors were to economise and make best use of in their scheme for the completed museum. A costly elevation, therefore, signalises a simple and economical arrangement of the vital conditions of the design. It is, perhaps, unfair to expect very sound or minute architectural criticism in any daily paper, but there is a cause for just resentment that The Times should hasten to lend the weight of its utterance to secure for the long projected S.K.M. completion a place also in the great limbo of Ministerial mishaps. It has been characteristic of Government building projects throughout, with scarce an exception, that they have found birth in a spirit of adequacy, not to say magnificence, and in a full recognition of their symbolic value and their national importance, and, then, under a process of budget-lightening economy, one and all have fallen

GROUND-PLAN.

A PROPOSED COUNTRY HOUSE. DESIGNED BY A. N. PRENTICE.

establish public opinion on the subject of the South Kensington Museum completion, and after opening with a "We have reason to believe, although no official announcement has been made," as it always has from birth upwards, it gravely prognosticates that the Government is about to pick up again its scheme for rebuilding the museum, from where it was dropped at the end of Lord Salisbury's last ministry. The Times then congratulates itself on the removal of the inflammable annexes, which it calls "tinder boxes." It then hopes that the Office of Works

considers that the six architects who were invited to compete in the S.K.M. Competition were concerned alone with their elevations; that the award was made to Mr. Aston Webb for the excellence of his elevation alone; and that this large sum is accounted for by the characteristic rich jewelled effect of Mr. Webb's design, and would have been reduced by the graver and broader employments of decoration in some of the other designs—Mr. Belcher's for instance. The public should understand, however, that the employment of Mr. Waterhouse as assessor on this occasion

away to effete and contemptible actualities. That Mr. Norman Shaw's building stands almost alone to dignify its purpose and its institution in the crowd of Government offices in and around Westminster, is due to the energetic action of Mr. Mathews, who was Home Secretary at the time when the project of New Scotland Yard was being absorbed into the starving process of official machinery, and snatched it out, and entrusted it to the best esteemed of our architects. It may be mentioned of the forthcoming War Office Buildings, if one may be allowed to

shelter one's responsibility behind the wise and cautious phraseology of *The Times*, that: "We have reason to believe, although no official announcement has yet been made in the matter," that three architects—a professor, a distinguished official, and one of the best known of our younger architects—have been deputed to select a firm with which, in their opinion, the commission to carry out the War Offices may most advantageously be placed. B. C.

Parish Life in England.

In the Nineteenth Century Magazine for January there is an interesting article by Dr. Jessop upon "Parish life in England before the Great Pillage."

He traces briefly the effect of the three successive conquests upon the original inhabitants of England, whom the Romans found "settled in defined areas." First came the Romans, then the Saxons and Angles, to be followed, after some "six centuries of consolidation," by the Norman Conquest. The interest of this article to the architect lies first in the importance attached to the development of village life in the Early and Middle Ages; and secondly, that this parochial life was the soil out of which English handicraft sprang. The Romans occupied the island about four centuries, and during that time many splendid roads were laid, new laws instituted and administered (*see Antiquary for January*), and they also paid special attention to textile manufactures, which seem, however, to have declined upon their withdrawal. The remains of their sojourn here are considerable, but it is probable that soon after the Normans took up their residence in England, the Roman influence, so far as the Arts and Crafts are concerned, rapidly dwindled. Traces of their influence is found, perhaps in that period of Architecture known as Roman; but from the end of the twelfth to about the beginning of the fifteenth century, the Arts and Crafts tell another tale—told by the commingling of Celt, Saxon, and Norman. The "six centuries of consolidation" by the Saxons and Angles witnessed but little development of parish life, but through the reign of William the Conqueror and onward the villages assumed a greater importance, and the handicrafts began to develop more rapidly. Dr. Jessop tells us "that there is no evidence of any clean sweep of old laws and old sentiments by the Romans, and that they left the village community, or any other organized social unit, as little distorted as possible; they left the people such self-government as they had attained to, superadding thereto some machinery for dealing out even justice as between man and man." From this note it may be inferred that when the Saxons, and at a later date the Normans, invaded the island, there were already a number of villages into which the conquerors infused the new spirit that germinated the village Architecture of the Middle Ages. The parish church, the object upon which the wealth of the village was lavished, was built, not by squire, nor by monk, but by the parishes. "The evidence on this point," says Dr. Jessop, "is abundant and positive, and is increasing year by year, that the work done upon the fabrics of our church, the painting of the lovely figures on the panels of the screens, the engraving of the monumental brasses, the stained glass in the windows—all this, up to about the sixteenth century, was executed by local craftsmen." It has only been possible to touch upon one or two points in the article, but readers who are interested in the fields from which sprang English Architecture should refer to this article in the Nineteenth Century Magazine for this month.

G. L. M.

ELECTIONS AT THE ROYAL ACADEMY.

At a general assembly of Academicians and Associates held to-day week at the Royal Academy, Mr. Edward J. Gregory, A.R.A., painter, and Mr. George Aitchison, A.R.A., architect, were elected Academicians. Mr. Lionel P. Smythe, painter, and Mr. H. H. La Thangue, painter, were elected Associates. Mr. E. J. Gregory has at last received the promotion which—had he chosen to exert himself beyond the point to which he has restricted his efforts—might have come to him any time during the past eight or ten years. But not since his lovely Scandinavia subjects, nearly twenty years ago has he set himself to put forth his full strength, although from time to time works of exquisite feeling and consummate artistry have come from his brush, both in oil and water colour. But not since his election as Associate, in 1883, has he produced a work so striking and so full of ability as the "Boulter's Lock," in last year's Academy—a picture which, born into the world after long travail, has now placed him

AMONG THE IMMORTALS.

The struggle was mainly between three Associates whose names "got on the blackboard," when Mr. Gregory received 19 votes, Mr. Seymour Lucas 11, and Mr. Aitchison 10. In the ballot between the two former 29 votes were cast for Mr. Gregory, as against 25 for Mr. Lucas. Mr. Aitchison, who became Associate in 1881, along with Mr. John Brett, is the President of the Royal Institute of British Architects, is the Professor of Architecture at the Royal Academy, the designer of Founders' Hall, and (what is, perhaps, best known, though not to his highest credit) Lord Leighton's house. As a decorator and a writer upon his Art, he is in the front rank, though he is apt to be considered, nowadays, "somewhat old-fashioned." With 25 and 16 votes respectively, his name and that of Mr. Seymour Lucas were inscribed on the blackboard; and when the ballot was proceeded with the result was a tie—with 27 votes apiece. In accordance with the rules, the President had to cast his vote, and he awarded it, according to tradition, to him who had been

WAITING THE LONGER.

and Mr. Aitchison was declared duly elected. Proceeding to the first of the elections for Associates, Mr. Lionel Smythe was the successful candidate. He is a half-brother of Mr. W. L. Wyllie, A.R.A., and has painted the coast of France for many years with a distinction and beauty that have not been lost among his artist admirers. Mr. La Thangue had received fifteen "scratches," and Mr. Smythe and Mr. Alfred East 13 each—a tie in the latter case needing to be worked off. Amid excitement 29 votes were cast for Mr. Smythe against 26 for his rival; and, in the final ballot, Mr. Smythe was successful with 28 votes over Mr. La Thangue by a majority of 1. Finally Mr. La Thangue was

ELECTED TO ASSOCIATE RANK.

In the second stage of this election, it was found that Mr. Alfred East and Sir George Reid—the accomplished President of the Royal Scottish Academy—had tied with 14 votes each, and this had first to be disposed of, when 29 were cast for Sir George, and 26 for Mr. East. The final ballot resulted in exactly the same figures as the previous election—Mr. La Thangue receiving 28 votes, and Sir George 27—a majority of one. In Mr. Lucas we have, doubtless, the next Academician to be elected from the figure-painters. Mr. Alfred East is now the chief of the landscape painters outside the Academy, and his summons is only a matter of time. Sir George Reid would be an ornament to any academy in the world; his superb portraits of the last two or three years having taken artists—and critics, too—by storm; while as a black-and-white man he is certainly one of the most accomplished and interesting in the country. Perhaps before a year is out these three artists will receive that academic attention which would, we are convinced, be warmly endorsed by the public.

THE CITY OF KASSALA.

IN a letter written from Kassala, the special correspondent of *The Times* describes the city, over which the Egyptian flag has just been rehoisted, as follows:—"The old city of Kassala can be described in a few words; the dervishes were here for some time, which signifies that but very little remains of the former buildings. Here as elsewhere in the last Egyptian provinces the followers of the Mahdi destroyed all they could, leaving behind them, of what was once a prosperous city of 40,000 inhabitants, only ruined walls and deserted jungle-overgrown streets, which are still strewn with the bones of the massacred citizens and garrison. The modern native town consists chiefly of straw *tokuls*; and there are but a few brick buildings, which have been erected by the Greek traders. In my last letter I spoke of the famous pilgrimage of Katmia, the mosque containing the shrine of the Morgani saint. It stands at the foot of the grand mountain Kassala el Luz, whose steep lower slopes, riven by gullies, where long grass and ebony trees find root, are crowned by stupendous barren granite rocks and precipices inaccessible to man. The Katmia is

A LARGE AND BEAUTIFUL BUILDING

of brick, which was designed by an able architect and cost a large sum. The graceful minaret still stands, but the Dervishes have hewn through the base of several of the columns supporting the edifice, so that the roof and many of the shapely arches within the cloistered mosque have fallen in. They have also torn the ornamental copper-work from the gates, windows, and elsewhere, not for any use that it might be to them, for it still lies broken and twisted on the ground, but out of sheer wantonness, as is the Dervish way. So now the Katmia stands, roofless, with floor overgrown with jungle, a picturesque ruin amid this wild scenery, its chambers haunted nightly by the jackals and hyenas. The wrecked tomb of the Morgani is now closed against the profane by a wooden door, and is yearly visited by a great number of pilgrims. Hard by the Katmia, amid what is now a waste of high halfa grass and bush, are to be seen the remains of many ruined houses. These were the villas of the wealthier citizens of Kassala, who here had pleasant gardens and shady groves, to which they used to repair during the summer heat. Of what was once Kassala but one building of any consequence remains whole. As one approaches this place the first object one sees, a conspicuous landmark rising above the bush-covered plain, is a lofty brick chimney, belonging to the cotton factory which was established here in the days of the Egyptians. The dervishes destroyed the machinery but spared the extensive building, which they converted into their Beit el Mal, or public store.

THE NEW ITALIAN FORT

now encloses the disused factory, whose capacious engine room and other chambers are used for the armoury, the officers' mess room, and other military purposes, while some of the boiler plates have been utilised in the construction of the fort drawbridge. This fort, erected by the Italians shortly after their capture of Kassala, could be held by a small force against any attack the Dervishes are capable of making. Its stout walls, about 11ft. in height, form a rectangle 630ft. long and 315ft. broad; they are surrounded by a deep moat and wire entanglements. There are at present six 9-centimetre and two 7-centimetre guns on the walls. The garrison (of native troops) is now small; but no fewer than eighteen Italian officers muster at the pleasant mess. Kassala fort commands a position of very great strategic importance. It stands immediately to the westward of the outermost of the parallel ranges which run from north to south through Erithrea and Abyssinia."

An extensive scheme of harbour improvement at Ostend, involving an outlay of over half a million sterling, will shortly be put into execution.

ROYAL ACADEMY.

NOTES ON THE STUDENTS' WORK.

THE works sent in for the prize competitions at the Royal Academy were on view last month. It has become the usual thing to say, year by year, that this exhibition is worse than ever before. This remark might apply, this year, with particular truth to the paintings submitted for the gold medal. So bad are these that, for the first time it is said, this prize has not been awarded.

The particularly low standard which everyone seems to have noticed the last few years may partly be accounted for, perhaps, by the fact that the Academy limited the age of admission to twenty-three years, which had the effect of keeping out many students of that age and over who had intended to enter the schools. The average age of the present

in November. The presence of so many immature and boyish performances is thus easily explained, without insisting *ad nauseum* on the lack of right system in the teaching.

In the sculpture this year the average is, perhaps, not very high, though it is redeemed by the charming work of Mr. Turner, which rightly wins the gold medal. This group is well arranged and carried out in a most artistic manner, and is far ahead of the others. In the modelling from the life, however, Mr. Turner, who is placed first, is more nearly approached by Mr. Bertie Pegram, who wins the second place. There is little to choose between them, but Mr. Turner's work is, perhaps, richer and more masculine.

On coming to the designs submitted for the Gold Medal in Architecture, we find the subject is "A Nobleman's Country House." A few years ago the subject set for the English Travelling Studentship was a *Gentleman's Country House*; this year it is a *Nobleman's*. The Academy thus draws a distinction, and this should be remembered.

nobleman's country house there is nothing more to be said.

It is a noticeable thing that those designs which more nearly approach in general conception the idea of a nobleman's house are the most unsuccessful in realisation, as if the subject was too much for the designers, while those who are content with the ordinary country house of commerce have more nearly realized their ideals.

It is surely a most important thing that the student should be impressed with the vital necessity of giving every building its characteristic form and appearance. That, for instance, a nobleman's house is not just a gentleman's house writ large. Such an award as this tends to create a contrary impression, and, therefore, must be deplored; and moreover, it is a question whether it is altogether fair to those of the competitors who have endeavoured to faithfully interpret the programme. Judging from the designs, there is reason to suppose that many of those who have failed, relatively speaking, at the more

AT THE ROYAL ACADEMY. DESIGN BY LIONEL NEWMAN BARRETT.

student is therefore lower than it was, say, ten years ago, and the standard of work is, naturally, lower too.

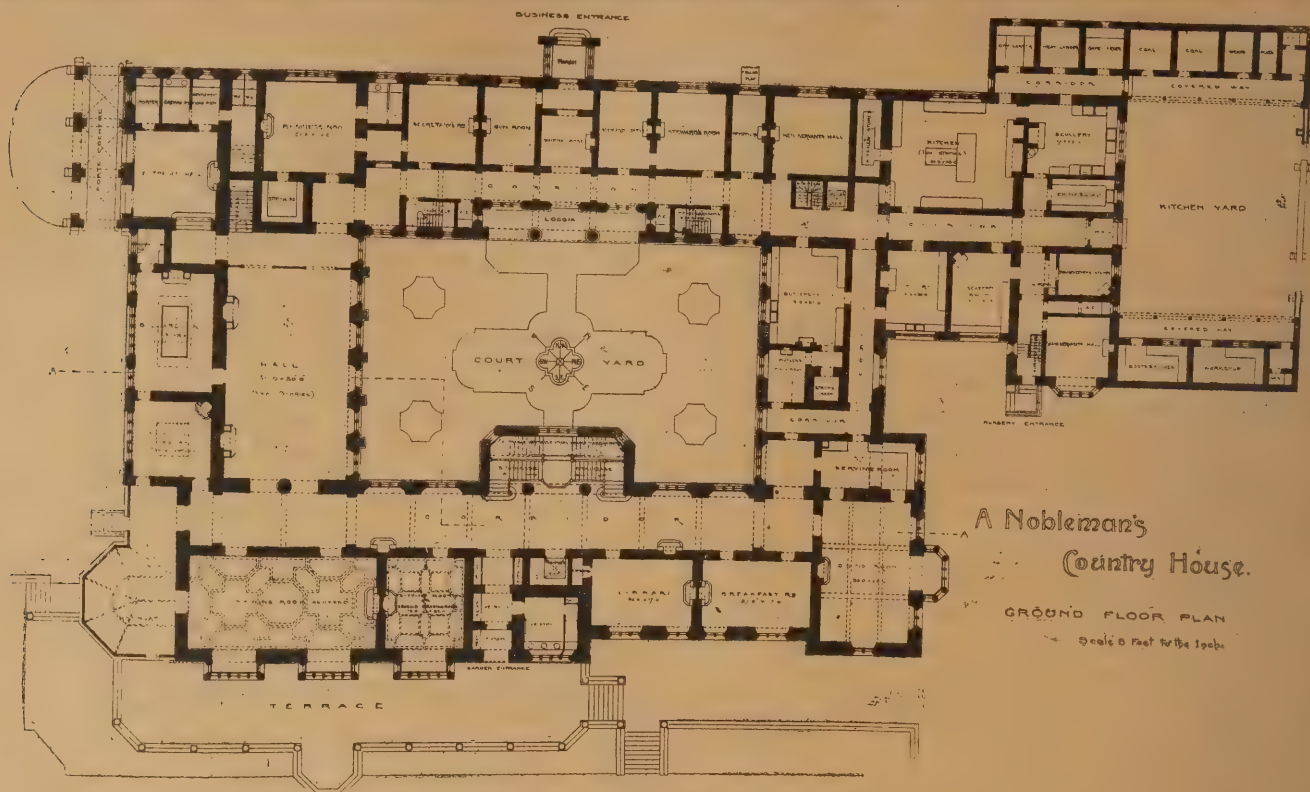

It is useless to shut our eyes to the fact that the great majority of the students of every branch of Art taught in the schools are attracted there principally by the prizes, which are substantial. It is hardly too much to say that if these prizes were abolished the schools would be practically empty, and might just as well be abolished too. The natural tendency on the part of many of the students was always to put off entering the schools as long as possible, so as to go there with more knowledge and stand a better chance for the prizes. The sudden application of this rule, without sufficient warning, had the effect of rendering ineligible many who were biding their time, to suddenly find themselves too old; but who, if admitted, would probably have contributed better work for the prizes than that here on view.

With regard to the painting in particular, it is understood that there is nothing to prevent the youngster just admitted from competing for the gold medal at once; that is, he may enter the schools in June and send in a picture

It is necessary to say at once that the prize design by Mr. Christie is not a nobleman's house, as distinct from a gentleman's; it is more that of the country squire or small landowner, and so does not properly fulfil the terms of the programme. It is of course a house that could be built in the country, and that might possibly be owned, and even at times occupied, by a nobleman; but it might equally well be owned and occupied by a merchant or well-to-do farmer. There is nothing about it that gives the particular character of a nobleman's house, neither has it anything like the required accommodation. How would it be possible to entertain here the large house parties, or, say, six to a dozen other noblemen with their wives and servants for the shooting or the races? There is only one bed and dressing-room suite in the house, besides that of the owner, whereas the proper accommodation would be more like half-a-dozen distinct suites, consisting of bed and two dressing rooms, bathroom, and w.c. complete—besides the single bedrooms and bachelors' wing. Judged as a country gentleman's house, there is something to be said both for and against this design, but as a

ambitious conception would have produced as complete a design as that of the winner if they had tried to do the same sort of thing. There is equally nothing in the winning design to lead one to think that its author would have been more successful than the others if he had attempted to design a nobleman's instead of a gentleman's house. When, in the opinion of the Academy, none of the designs which aim at a right interpretation of the subject are worthy of the prize, it might possibly be considered more fair to withhold the prize rather than to award it to one, however good in itself, which is not exactly what is asked for.

The £25 premium in the upper school is won by Mr. Lacy, with a design for a gateway tower to a college. This design is much as usual, with the exception of a variation of the tree of life growing out of the keystone of the arch, the branches of which have shields hanging to them. This hardly improves the design—it seems to rather spoil the proportions and force the window up to an unnecessary height—and, besides, is more adapted to a painting, where there are no stone joints to be considered. This design is illustrated by a drawing shaded up in a quite impossible

AT THE ROYAL ACADEMY. BY LIONEL N. BARRETT.

manner. No. 235 is more out of the common, but runs the risk of being labelled eccentric, which is perhaps more really inartistic than the commonplace—present fashion to the contrary notwithstanding. The awkward shape of the stairs, the square piers placed diagonally, instead of columns, are not reasonable.

The £10 premium in the lower school is won by Mr. Lee by a design for a lych gate. This, too, is not altogether free from the charge of eccentricity, but all the same it is perhaps the most interesting design in the Exhibition. The figures, surely, are out of place, and it is a question whether it would look so well in execution. Nos. 242, 243, and 244 are nice designs for college rooms.

The plan of an Art gallery for a large town is won by Mr. Hide. This is a simple, straightforward sort of plan, but the arrangement of the angles is weak. The central feature is surely too large in proportion to the rest of the plan, and considering how much space is occupied by this, more might have been made of the stairs; as it is, the whole of the traffic up and down has to pass through a 6ft. opening.

A. R. J.

THE award in the Skipton and District Cottage Hospital competition is as follows: (1) Mr. E. C. H. Maidman, Edinburgh; (2) Mr. W. F. Edwards, Birmingham. There were twenty-two competitors.

TOWARDS the end of this month St. George's Hall, Langham Place, will be on the lists at the Auction Mart. The leases to be sold include that of the large hall, which seats 850 persons, and has lately been redecorated at a cost of £1500; of 4, Langham Place; of 76, Mortimer Street, now occupied by the London Academy of Music; and of premises in Mark's Yard, Great Portland Street, which has been used as a stage entrance.

"NEW WALKS BY THE RHINE" is the title of a book by Percy Lindley, to be published shortly. Starting from the Rhine mouth at the Hook of Holland, "New Walks by the Rhine" will cover the picturesque wooded and rocky side valleys of Rhineland, from the Ahrthal, near Cologne, to the Neckarthal and the "Blue Alsatian Mountains" of the Vosges; and will include the districts of the Taunus, Eifel, Odenwald, Hunsrück, and the Palatinate. Mr. J. F. Weedon will supply the illustrations.

A WORLD-WIDE COMPETITION.

AN ARCHITECTURAL PROJECT—FROM AMERICA.

SAYS Mr. Geo. F. Parker, Consulate of the United States, in a letter to *The Times*:—"Some particulars which have recently reached me, concerning an architectural enterprise devised by the University of California, may not be without interest. It is the purpose of its projectors to ask for the submission of plans for the erection upon the grounds belonging to the University of California, at Berkeley, in that State, of what the preliminary prospectus, issued by the board of trustees, terms 'a city of learning.' The grounds of the University cover an area of 245 acres. The elevation above the sea-level at the lowest point is about 200ft., while the greatest elevation is over 900ft. Behind this lies a chain of hills rising another 1000ft. The land has an outlook over the bay and city of San Francisco, as well as over the neighbouring plains and mountains and the ocean. The trustees announce that it is their intention to treat the ground and buildings together, landscape gardening and Architecture forming one composition, which, it is hoped, will never need to be structurally changed in order to accommodate the future needs of the University. Upon this site it is proposed

TO ERECT AT LEAST 28 BUILDINGS,

all mutually related, and at the same time cut off as a whole from anything which might mar the effect of the picture, the assumption being that these will meet the needs of the University in the future, although it is suggested that the developments of science may impose new duties upon the institution, which will render necessary some alteration of this arrangement. All the buildings thus far erected are to be ignored, and the grounds are to be treated as a blank space, to be filled in according to the taste and the demands of the successful architect or architects. It is, of course, evident that, in order to carry out such a scheme as this, a large amount of money must be forthcoming. So the announcement is made by the trustees that \$5,000,000 (£1,000,000) have already been pledged, and that all the necessary funds will be forthcoming as fast as the work can be carried on.

But there are to be no definite limitations of cost, material, and style so far as the plans are concerned. All this is to be left to the unfettered discretion of the designer, who is asked to record his conception of an ideal home for a University, assuming time and resources to be unlimited. It is proposed that the plans shall be chosen by

COMPETITION OPEN TO ALL THE ARCHITECTS OF THE WORLD,

with an international jury of five men, who will have full charge of it and will award the prizes. It is hoped in this way to command the co-operation of the best architectural genius in the world. There will be two competitions, and ample prizes will be provided. Maps, casts, and photographs of the grounds will be placed at various accessible points in Europe and America for the convenience of architects who wish to compete. The programme has been prepared by Professor Gaudet, of the School of Fine Arts, of France. This was under consideration by the trustees when the prospectus was issued some weeks ago, and will soon be ready for distribution. Copies are to be obtained, when issued, from the various architectural societies in America and Europe, or upon application to the board of trustees at their office, 217, Sansome Street, San Francisco, California. I have no knowledge of the scheme other than that derived from the prospectus, but the relation which Mrs. Hearst bears to it is an earnest of its genuineness. She is known everywhere to be able, willing, and anxious to carry out large plans for the benefit of education on the Pacific coast. I venture, therefore, to hope that these meagre particulars may be of interest to your readers, and especially to architects."

A PROPOSAL is on foot to make an addition to Girton College, rendered necessary by the want of space. It is proposed to build a large new hall, with the necessary additions to the domestic service department (making use of the present hall as a much-needed adjunct to the library), a chapel or prayer-room, new lecture-rooms, and rooms for about fifty students, to which 100 more may be added hereafter as they are wanted. The present scheme is approximately estimated as likely to cost not less than £50,000.

THE ABBEYS AND CATHEDRALS OF SCOTLAND.

By P. MACGREGOR CHALMERS.

LECTURING before the Edinburgh Architectural Association, on the Abbeys and Cathedrals of Scotland, Mr. P. Macgregor Chalmers, President of the Glasgow Architectural Society, gave a survey of Mediæval Art in stone in Scotland, tracing its development from the earliest structures to the Reformation. The site, he said, of the first Christian church erected in stone was more likely to be found in the ruins lying to the west of Whithorn Cathedral than at the little chapel on the Isle of Whithorn. At the former site the plan indicated was in conformity with that adopted in early Romanesque structures, and there could be little doubt that the general character of the design of this first church was shown on the seal of Candida Casa. St. Regulus Church, at St. Andrews, described by most writers as having been built about sixteen years only before the great transeptal Cathedral of St. Andrews, alongside, was clearly of pre-Norman design. It was probably erected about the end of the tenth century. Designed originally as a church, with an apse and western tower, a new nave was added to the west, but still in pre-Norman times. This nave has disappeared, but it is shown on the ancient Seal of St. Andrews.

THE STATE OF ART IN EARLY TIMES

was illustrated in the manuscripts and sculptured crosses, the famous Ruthwell cross being specially described. Attention was also directed to the orientation of the early fabrics. The need for a careful record in every case was emphasised by reference to the Church of St. Mary on the Crag, at St. Andrews, and to the ancient tower incorporated with the more modern Cathedral at Dunblane. The character of the work of the twelfth century was illustrated from Durham Cathedral, its interesting parallel at Dunfermline Abbey, &c. The work of the end of this century was shown in its most perfect development in the nave of Judburgh Abbey. Mr. Chalmers also described his recent discovery of the north and south aisles of the choir erected at Glasgow by Bishop Joceline. The characteristics of thirteenth century work were principally described as found at Glasgow in the beautiful lower church and choir, and at Dunblane

Cathedral. At this point special reference was made to the brasses which have recently been placed on the floor of the choir of Dunblane Cathedral, to mark the supposed resting-place of Margaret Drummond and her two sisters. That memorials such as these have been permitted, and that such statements as are contained on these brasses should be approved of by the authorities in charge of the Cathedral, may well occasion surprise. That they are placed within sacred walls, on the floor of a church, increases the offence.

THE ART WORK OF THE FOURTEENTH CENTURY

In Scotland was still greatly misunderstood, the unwise deduction from the supposed excessive poverty of the country having served to lead students astray. Scotland would be bereft of some of its finest work if the work of the fourteenth century was swept away. Particular attention was directed to the development of window tracery during this century, although it was unfortunately true that, owing to its extreme delicacy, it was seldom found in a state of perfect preservation. The beautiful work executed at the end of the century at St. Andrews and Elgin was described, with the interesting example at Bothwell Church, now being restored. The opinion was here expressed that the new curvilinear tracery introduced into the windows of the church was of somewhat too late a character, the influence of French Art being more pronounced than was consistent with the date of the foundation. The Art of the fifteenth century was illustrated by the work at Lincluden, Rosslyn, Linlithgow, Melrose, Paisley, &c. The hope was expressed that a careful record was preserved for publication of the details of the original chancel arch at Linlithgow, discovered during the recent restoration. Melrose Abbey was described in detail, with special reference to the work of the mediæval architect, John Marow or Murray, whose autobiographical inscription is still preserved there. Many new and interesting facts were given regarding the history of Paisley Abbey, extracted from the lecturer's manuscript sketch prepared for publication. The current opinions on many points were shown to be unfounded, and the statement so confidently made, that the abbey was destroyed by the Reformers, was proved by the building itself to be but the fruit of ignorance and prejudice, since the abbey was in a more ruinous state in the year 1498 than it is at the present day.

A FEAT IN CONSTRUCTION.

THE New Brighton Tower is finished. It was in July, 1895, that the work of building this notable pile was commenced, and now the skeleton-like tower has become a familiar feature among the landmarks of the port of Liverpool. The New Brighton tower holds the unique distinction of being absolutely the highest spire in the whole of the United Kingdom. The distance from the ground to the bright copper ball planted on the top of the flagpole up in the sky is 567ft. The Eiffel Tower of Paris claims to be the highest structure of the world, reaching 984ft. above the earth, while the Cathedral of Cologne, in Germany, probably comes next, with its spire 511ft. high; but if Cologne Cathedral were reared at New Brighton its apex would still be more than 50ft. below the top of the Tower, and even the famous Blackpool Tower, with its 518ft. 9in., would be, so to speak, a head shorter than the New Brighton erection. Other English buildings of great height are the Salisbury Cathedral, 404ft.; St. Paul's, London, 365ft.; Norwich Cathedral, 315ft.; Lincoln Cathedral, 300ft.; Ely Cathedral, 270ft.; and Canterbury Cathedral, 235ft. It will be seen, therefore, that the New Brighton Tower is legitimately entitled to boast as the highest structure in the United Kingdom. In shape

THE TOWER IS OCTAGONAL,

standing on eight legs, the base being 150ft. across. It is constructed entirely of mild steel of British manufacture. Its weight in tons is 1760, while it is calculated as being sufficiently strong to withstand a pressure equal to one and a half times the force of the highest recorded gale in these latitudes. Messrs. Maxwell and Tuke, architects and engineers, of Manchester, designed the structure, which has been favourably reported upon by so eminent an authority as Sir Benjamin Baker. The actual work of construction has been in the hands of Messrs. Handyside, of Derby, with Mr. John Ashley, who had practical experience of the building of the Blackpool Tower, as clerk of the works. The lower portion of the great iron structure is hidden from view by a block of buildings, now approaching completion, and towering 90ft. from the ground. In this block, on separate floors, there will be a fully-equipped theatre for stage plays, with seating accommodation

A Nobleman's
Country House.

FIRST FLOOR PLAN

Scale 5 Feet to 1 Inch

AT THE ROYAL ACADEMY. BY LIONEL N. BARRETT.

in the shape of an amphitheatre for 3000 persons; above that a concert and ball room with a parquet floor laid upon springs, with promenade and outside balconies offering splendid views of the landscape and sea for miles around; and, still higher, the third floor is to be furnished as winter gardens, and will be covered in with a glass dome roof. In connection with all the halls mentioned, luxurious lounge and refreshment rooms are being provided. Visitors may reach the various floors in this building by any of four staircases leading from the two main entrances on the ground floor, or the ascent may be made in one of the four elevators provided for convenience, each of which will carry about a score of people at once. It is from

THE WINTER GARDENS AT THE TOP

of the main buildings that visitors will commence what may be described as the actual ascent of the tower. There is a staircase

MEMORIAL TO LORD LEIGHTON.

THE Arts and Crafts Technical Institute, added to the South London Art Gallery, Peckham Road, Camberwell, by Mr. Passmore Edwards, as a memorial to Lord Leighton, was recently opened by Sir Edward Poynter, P.R.A. The gallery and the adjoining lecture-hall were opened some years ago by the Prince of Wales, but owing to enlargements and the building of a new frontage, the entire Institution has been practically remodelled. In 1892 Mr. Passmore Edwards made a gift of £3000 to build and furnish a library and lecture-hall in connection with the picture gallery. The building comprises four large studios, and also the workshops for craft work, which are placed in the basement. A large office is provided on the ground floor for the curator and art director. Retiring and cloak-rooms are supplied for the students, including a ladies'

is the builder. The cost is estimated at between £6000 and £7000.

SIR EDWARD POYNTER ON LEIGHTON'S WORK.

Sir Edward Poynter, in declaring the building open, said it was due to Lord Leighton's admirable energy that that gallery had become a permanent institution. The very exalted place which Lord Leighton held as a painter was, in view of the ceaseless energy which he displayed in other matters, as well as of his numerous brilliant accomplishments, apt to be overlooked, though it was by far the best and most important side of his many-sided nature. But the exhibition of his works held last winter in the Royal Academy established him beyond all exception in almost a unique position in this respect, for it positively militated against Lord Leighton's reputation as a painter that he should excel so greatly in other things. He was glad, therefore, that this fine building

AT THE ROYAL ACADEMY. PLAN OF AN-ART GALLERY FOR A LARGE TOWN. BY HORACE C. R. HIDE.

leading up inside, but this is devoted to the use of workmen only, and for visitors there are available four elevators of a more commodious pattern than the lifts in the main buildings. All the lifts will be worked by electrical power, the Tower Company having laid down at the far end of their grounds a station capable of supplying the whole area with electricity for working the necessary machinery for lighting and for cooking.

THE Sheffield Council has decided to purchase the undertaking of the Sheffield Electric Light and Power Co., at the price offered by the Company, namely, £220 of Corporation 2½ per cent. Stock for every £100 of capital actually spent by the Company.

SOME years ago a large number of Phœnician inscriptions were found in the island of Sumatra, and it is now supposed that they were made by the Phœnician fleet which Alexander the Great sent down the river Indus to regain the Persian Sea. The characters belong to the fourth century B.C., and some of them are similar to those on the monuments of Citium in Cyprus.

lunch-room on the mezzanine floor. A residence is furnished for the porter and caretaker. A fine north light is obtained at the rear by means of very large studio windows, and those on the top floor extend well into the roof. Models' rooms are provided to the main studios. The building is of Portland stone, with red brick facings, the spaces between the ground floor arcade being built with glazed red bricks. The style is Renaissance, richly treated with carvings, by Mr. W. Goscombe John, who also executed the sculptured pediment which contains life-size figures representing "Architecture," "Sculpture," and "Painting." The flock wall papers have been specially made to the tints supplied by Sir E. Burne-Jones and Sir Wyke Bayliss for the Art Gallery. The Art Galleries are at the rear of the Institute, and the grounds at the back have also been laid out as ornamental gardens from the plan of the architect, Mr. Maurice B. Adams. A thorough way is contrived below the ground floor level as an approach to the public gardens, and also for the purpose of bringing in works of art intended for exhibition in the picture galleries or for use in the technical institute. Mr. J. C. Richardson, of Peckham,

had been dedicated to the memory of so great a man. It could not but be of advantage that in this picture gallery, which was part of Mr. Passmore Edwards' munificent gift, some of Lord Leighton's work should from time to time be seen, or even be found permanently located there. There was a School of Art attached to the Institution, and he could conceive

NO BETTER EXAMPLE to set before students than the work of Leighton. Lord Leighton stood almost alone among English painters as an artist in the true sense of the word, that was, as having a complete mastery of his craft, and as opposed to that fatal amateur element which was so frequently seen in our artists and craftsmen. In this way he was an example not only to painters, but to all who practised the arts in any form. Schools of art might be of greater value if their proper purposes were kept in mind, and if it was remembered that a dilettante admiration for old art and enthusiastic talk about beauty of form and feeling for colour went for nothing, that dabbling in wood-carving or pottery did not make workmen, and even originality of design was only

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
January 26th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

MR. EDWARD GABRIEL (of Messrs. Edmeston and Gabriel) the assessor appointed by the Committee of the Westbury-on-Frym National Schools, Gloucestershire, in connection with the recent limited competition for new schools, has placed the design submitted by Mr. W. S. Bernard first, and that of Mr. Henry Hirst second in order of merit, and the selection has been confirmed by the committee.

A SCHEME for the alteration and improvement of Manchester Cathedral has been prepared. It is proposed to provide a covered approach to the Cathedral, to be used on State occasions by ecclesiastical and civil dignitaries and public bodies. It is proposed to provide a west or "Victoria" porch, and a niche has been prepared for the reception of a statue of Her Majesty, to which will be added, as funds accrue, figures of notabilities in Church and State. The total outlay is estimated at £6000.

THE late Mr. J. L. Pearson had the care of so many of the greatest and noblest ecclesiastical monuments that on his death lovers of Christian Art were much concerned at the selection of architects to fill his many important posts. Chiefest of these, after the custodianship of Westminster Abbey, was the position of architect to Truro Cathedral, which is not yet half finished. Mr. Pearson brought to bear on Truro Cathedral the full force of an architectural genius, which was only equalled by its reverence for the beautiful and for sacred things, with the result that he has now reared in the Cornish city a cathedral which in its unfinished state will bear comparison with some of the greatest architectural works of olden days. Truro Cathedral was, in fact, the greatest ecclesiastical architect's *magnum opus*, and it will delight lovers of the truest architecture and the friends of the deceased illustrious architect to learn that his son, Mr. F. L. Pearson, is, as we announced last week, to be entrusted with the completion of the great Cornish fane.

At a recent meeting of the St. Olave's (Southwark) Guardians, ten tenders, were opened for the erection of a new workhouse at Ladywell, Catford. The new building is to accommodate 800 persons, and the architect's estimate was £156,000. Messrs. Shillitoe, of Bury St. Edmunds, whose tender was £158,785, were the successful firm. A motion that the work should be confined to metropolitan firms was negatived, but a resolution was adopted requesting Messrs. Shillitoe to give consideration to the claims of London workmen, and especially to residents in St. Olave's Union.

FROM Sir Edward Poynter's report on behalf of the Committee of the British Fine Art section at the Brussels International Exhibition, it appears that British pictures took more awards in proportion to pictures exhibited than any other country; and the actual number of awards (20) was only two fewer than the Belgian awards, although the Belgian collection was far more extensive. The following is the list of awards:—*Medaille d'Honneur*.—L. Alma-Tadema, R.A. First Class Medals (Painting).—F. Dicksee, R.A.; H. Herkomer, R.A.; J. C. Hook, R.A.; E. J. Gregory, R.A.; Sir J. D. Linton, P.R.I.; J. W. Waterhouse, R.A.; J. Seymour Lucas, A.R.A.; and J. S. Sargent, R.A. First Class Medal (Sculpture).—E. Onslow Ford, R.A. Second Class Medals (Painting).—S. J. Solomon, A.R.A.; J. Lavery; D. Murray, A.R.A.; J. W. North, A.R.A.; W. Q. Orchardson, R.A.; Charles Green, R.I.; Mrs. Allingham, R.W.S.; W. W. Ouless, R.A.; J. Aumonier, R.I.; G. Clausen, A.R.A.; R. Macaulay Stevenson; (Sculpture) G. Frampton, A.R.A.; A. Drury; (Engraving) D. Y. Cameron; and (Architecture) the late J. L. Pearson, R.A.

A COLOSSAL hotel and pavilion is being erected on the Oval, Kennington, and is to be ready for use before the current season opens. The style is ornate, and the material terracotta tiles. The Oval belongs to the Duchy of Cornwall, and is surrounded by a varied class of property; some very old and some very new quaint styles of Architecture, interwoven with modern variations, with a gas-works to add coldness to the landscape.

BLOOMSBURY SQUARE is up in arms against a proposal to desecrate its historic precincts with a tramway. Such an innovation is enough to make the muddy statue of Charles James Fox, on the north side of the enclosure, shiver in his Roman toga and drop to the ground as an antiquated incumbrance the roll of Magna Charta which he holds in his hand. The scheme propounded by the London County Council is to extend the tramway line, at present ending in Theobald's Road, to Bury Street, which would involve the necessity of passing along the south side of the square, and to protest against that invasion a deputation of the inhabitants has waited on the St. Giles's District Board of Works, who ultimately decided unanimously to oppose it.

An artist in London is fastidious on the subject of ecclesiastical Art. He broaches the strange heresy that every church should be a sanctuary of truth. May I (says a correspondent) be daring enough to say I sympathise with him? In my native town there is a grand church window containing in separate painted panels the Twelve Apostles. The Twelve were all Jews, yet there is not one Jewish face among them; the Twelve were all poor men; yet they are attired in robes as flowing and as gorgeous as the most magnificent of Emperors is at his Coronation. Ecclesiastical Art makes even the fishermen Raphaellesque. They have the beards of Greek philosophers, the trailing trains which, in the case of Kings, are borne up by pages. In illustration of the miraculous draught of fishes, they are of such stature, that the greater miracle seems to be how one deeply laden boat could carry any one of them and live. Previous to the great fire in York Minster there was a fine window there (I have not seen the window since) where the Apostles were, in colours and corpulency, as splendid and as stumpy as the gaily-dressed and broad-shouldered Jacks on playing cards. Could the Apostles return to earth and see for themselves these extraordinary idealisations would they not be a little surprised?

THE Times, in returning, in a recent issue, to a pet subject—the completion of South Kensington Museum—says: "We have reason to believe, although no official announcement has yet been made in the matter, that another great step in connection with the museums of London has at last been decided upon. The agitation in favour of completing the buildings of the South Kensington Museum, which was last year so greatly strengthened by the

alarmist interim report of the Select Committee, has not been without its effect. We have so frequently urged the Government to take this matter in hand that we learn with much satisfaction that the decision to build has practically been taken. At present, as we have often pointed out, the South Kensington buildings are overcrowded, inconveniently arranged, and unsafe. Educationally, they are of much less use than they could easily be made, while, as the committee pointed out, the number of temporary and inflammable annexes in and about the main building constitute a most serious danger. Something has already been done by the removal of a few of these tinder-boxes, but this has only increased the overcrowding. From every point of view, in fact, the need for completing the building has long been obvious.

"We hope," continues the Times, "that the Office of Works, which will, of course, have the practical control of the matter, will remember that what it is engaged upon is the building of a museum, that is to say, of a storehouse, mainly educational in purpose, of a number of objects valuable for their beauty. It follows that the main object in view should be to build galleries in which these things can be preserved in safety and well seen. To this strictly practical end everything else ought to give way. There was, a few years ago, an architectural competition for a design of the new buildings, and it was understood that the plans of one of the most distinguished of our younger architects, Mr. Aston Webb, had been selected. Undoubtedly Mr. Webb's design would have worked out into a fine building, but what is wanted is not a fine building, which will cost a fine sum of money, but a plain, tasteful building, well-arranged for the purpose for which it is intended. That Mr. Webb could plan such an edifice there is no doubt whatever, but whether the final choice of the Government falls upon him or not, we are convinced that the necessary work could be done and a worthy building be raised for a very much smaller sum than the £400,000 that was mentioned when the matter was last under discussion."

At the final meeting of the Commission of Sewers a deputation from the Ward of Cripple-gate Fire Committee, headed by Alderman Sir Henry E. Knight, the chairman, attended and made the following suggestions for effecting improvements in the district affected by the recent fire: "(1) That the widening of Jewin Street affords the best basis for arrangements for new streets; (2) That after the widening of Jewin Street the site left on the north, now occupied by the premises forming the south side of Jewin Crescent, might with advantage be appropriated to the purposes of the central fire brigade station for London; (3) That, in addition to the widening of Jewin Street, a new street be formed from Jewin Street opposite the west corner of Jewin Crescent, to Wood Street facing London Wall; and (4) that Well Street and Hamsell Street should not be rebuilt, but a new street 60ft. wide be formed to take their place leading from Nicholl Square to Jewin Street, and continued northwards through Bradford Avenue to Redcross Street."

WHEN completed, the Terminus Hotel, which is now under construction in Marylebone for the Great Central Railway, will be one of the largest and finest hotels in the Metropolis. The style of the building, for the design of which Colonel Edis, the architect of the Constitutional Club and many other prominent buildings, is responsible, is a free treatment of Renaissance, and the materials chiefly used in the façade are red brick and terra-cotta. A handsome central clock tower is the main external feature. In front there are double entrances for foot passengers and vehicles from Marylebone Road, leading into a spacious covered courtyard. A large lounge entrance, with arcades on each side, will probably be greatly appreciated by visitors at the hotel, especially as it is intended to lay out the ground between the hotel and the road in ornamental gardens. Internally the arrange-

ments provide for a noble banqueting hall 150ft. long by 44ft. wide, and a coffee-room 120ft. long by 44ft. wide. Many of the newest features which have found favour in American hotels of a similar kind are being introduced, and the latest principles of fireproof construction are being followed.

A NEW red-brick building in Fleet Street strikes on the gaze of the passer-by who did not suspect its existence until the old front had been suddenly stripped away. This transformation is the beginning of the end for those houses on the south side of London's narrow and crowded thoroughfare, whose doom is involved in the "setting-back" improvement. If the much-needed operation is continued with equal despatch there will be little cause to complain of the temporary inconvenience.

PLANS have been approved by the authorities of Her Majesty's Woods and Forests Commission for rebuilding the south porch of the ancient abbey church of Sempringham, near Billingborough. This is to protect from the weather its famous door, with its beautiful iron scroll work, and the Norman arch with its exquisite chiselling, both of which date back to the 11th century. The proposed work is estimated to cost £190, and towards this sum the Lords of the Treasury have contributed £100. The living is in the gift of the Queen, and the new porch will form a memorial of her Diamond Reign.

THE Thames authorities have undertaken a great work—the construction of a new bridge between the Middlesex and Surrey shores at Vauxhall. The existing bridge is perfectly sound, and was made to last until Doomsday, as the Americans said of the buildings in England. It is, however, a most unpicturesque, and even rude, structure, and is to be replaced by one 8ft. wider than Westminster Bridge, so far our chef d'œuvre of trans-Thames highways. Old Vauxhall Bridge must have some ancient memories, "extensive and peculiar," like Sam Weller's knowledge of London, for it was, in the last century, the high road for one part of London to Cremorne and the other Gardens which flourished hereabouts well through the first half of the present century. There used to be a derisive saying, "as thin as a Vauxhall slice," in sarcastic commentary upon the dexterous attenuancy of the sandwiches served at the local gardens. With the bridge will disappear the last relic of the way that Londoners once enjoyed themselves.

A REMARKABLY interesting bit of old London has been unearthed during the process of demolishing some shops in Mitre Street, Aldgate. In taking down the back wall of the premises, the workmen came upon an arch and spandrel of the ancient priory of the Holy Trinity, or Christ Church. In mediæval times the priory was founded and endowed by the Empress Matilda, and until 1531 the monks lived in undisturbed possession. With the coming of Henry VIII., however, Christ Church shared the fate of the other monasteries, and the handsome building was subsequently converted into dwellings by Sir Robert Audley. When, in course of time, the splendid old structure was demolished to make way for necessary alterations in the neighbourhood, some of the sturdy stonework of the building was still left among the walls of the new premises. The arch that was brought to view recently is thought to have been a portion of the refectory, but some authorities hold that it formed part of the infirmary, as the refectory was not so far east. So sound and solid were the stone and rubble of the old arch, that as new premises were from time to time built on the site, the relic had been allowed to remain as a support. Very soon the builders will have hidden out the old arch behind the wall of some new shops, but unimpaired by centuries, the ancient span will once more be called upon to bear its share of weight, and to-day it looks so hale and so steady that when another century has passed, wondering workmen may look upon it, and, looking, find it still fit for duty.

IN opening the conference of Science and Art teachers, held at the Society of Arts Rooms recently, Mr. C. J. Addiscott (Daubeney-road Board School, Clapton), President of the Union, devoted the principal part of his address to criticism of the Science and Art Department. One of the great needs of England at the present time, he urged, was a sound, workable system of technical instruction, based upon Science and Art teaching, which itself must be based upon a solid foundation of primary instruction. Regarding science and art teaching as a tender plant that needs kindly culture, he held that this must be done by expert hands and not by amateurs who may tread it underfoot or occasionally tear it up to see how it is growing. Although he could not now discuss the question of foreign competition, he wished to emphasise the disastrous fact that with the country ripe for the adaptation of its educational machinery to its peculiar needs and conditions, yet the Science and Art Department, which is mainly responsible for an effective answer to the nation's demands, stands to-day, from the point of view of the great army of teachers working under its banner, and, he believed, from the point of view of the public also, in an atmosphere of suspicion and distrust, of dissatisfaction and discontent. Admitting the good work done in the early days by South Kensington in the training of teachers, the establishment of classes, and the encouragement given to museums and art galleries, Mr. Addiscott held that it had failed to march with the times, and had become an anachronism. No doubt progress had been made, but evidence on all hands showed that progress had not been in proportion to the general progress of the country in other directions. The fact was that since South Kensington lost the influence of the Prince Consort, it had become a thing of shreds and patches. It had become a harbour of refuge for many of the worn-out derelicts of the War Department who could not realise the requirements of modern times.

PRIVATE letters received by a correspondent of the New York Tribune give news of most important discoveries made by the German archaeologists excavating on the site of the ancient Priene in Asia Minor, opposite the Island of Samos. Years ago an English expedition excavated and studied the Temple of Athena, the chief sanctuary of the city, built at the order of Alexander the Great. The work was then abandoned, and meanwhile the ruins have been so thoroughly exploited and wasted by the neighbouring population that nothing is left but a confused heap of stones. In 1895 the work of exploring the ruins of the city was resumed, this time by Germans under the direction of the Berlin Museum, and at the expense of the Prussian Government. The architectural work has been placed in the hands of the young architect, Wilhelm Wilberg, a former student and assistant of Dr. Dorfeld. The work has now proceeded far enough to determine its extraordinary importance. A buried city, preserved almost in the completeness of Pompeii, is coming to light. Up to this time no Greek city has been excavated that gives any clue to the arrangement of streets, public squares, monuments, and public buildings, or to the Architecture of any considerable number of private houses.

HERE we find a city, to be sure, of the Hellenistic period, laid out with great regularity, with streets crossing at right angles, with shops, colonnades, market-places, theatres, a council house, and a great number of private houses preserved in such completeness as to display their general Architecture, distribution of space, use, decoration, and equipment. South of the great square of the temple alluded to above, and closely adjoining it, has been found the great market-place or agora of the city, which was surrounded on all four sides by broad colonnades, of which that on the north side was peculiarly noble and stately. Adjoining this at one end, and opening upon one corner of the agora, was found a small square building, constructed somewhat like a theatre, which was evidently the council-house of the city. It is

marvellously well preserved. Sixteen rows of seats are still in place. The walls, doors, windows, platforms, &c., are all preserved. One of the side walls ends in a massive arch, which, as being demonstrably a work of the fourth century B.C., must rank as the earliest, or at least one of the earliest, specimens of the arch in Greek construction. The whole building represents something entirely unique in the relics of Greek Architecture. There has also been found a small theatre, in which the stage structure, the skene, is still standing entire. Three doors open from it upon the orchestra, and the proscenium, with its rows of columns and the architrave above them, remains intact. No Greek theatre as yet discovered is so perfectly preserved as this, and in the future discussions of the "stage question" this structure is likely to assume a leading place.

A PROPOSAL having been made for the enlargement of Charlcombe Church, Bath, a correspondent writes: "A rumour is abroad that a scheme for the enlargement of the venerable church of Charlcombe is being promoted by a few parishioners. I sincerely hope that, for various reasons, the rumour is not true. It means a fatal blow to the historic traditions that lend such an unique interest to this church, which, after more than 700 years direct connection with Bath Abbey, retains a small portion of its Norman wall and much of its original form and pristine simplicity of character. The church, which is dedicated to St. Mary, consists of nave, chancel, and south porch. It was thoroughly repaired prior to the Reformation. The extreme length is about 51ft., and the width 21ft. The present structure is mostly Perpendicular, with some remains of earlier Norman work in the tower arch and chancel arch. There is also a north doorway of Norman character, which is now blocked up, and is susceptible of careful restoration. The porch also is of early character, and the south door is supposed to be a modern restoration of the old Norman door. The font is of a cylindrical bowl-shaped form, and Norman in character, with a carved band of lilies round it. Near the altar is a monument by Ford, of Bath, to Lady Barbara Montague, who died in the year 1766.

"THERE is a small bell tower at the west end 6ft. square, corbelled out from the wall. Originally it contained two bells, but only one now remains. The church was restored a few years ago, when the chancel walls, and part of the south wall of the nave were rebuilt, a new roof was put on the nave, and the area reseated. The circular pulpit is of stone. The windows, with but one exception, are filled with stained glass, illustrating subjects from the life and miracles of our Lord. There is also a carved stone reredos containing the symbols of the four evangelists, Agnus Dei, &c. Now I do not mean to say that all that has been done in the past is defensible; but in the main the church, in its walls and general iconography, retains much that is characteristic of a past age, and still commends itself to the loving care and protection of Bathonians as one of the most perfect relics we possess. I am unable to conceive any present emergency that would justify any dislocation of the walls of the dear little fabric under the plausible designation of enlarging the church. It would, indeed, be about as ruthless a piece of vandalism as even ignorant and unreflecting church spoilers could accomplish."

HEINRICH HEINE's latest monument has been finished at Laas, in the Austrian Tyrol, and conveyed to New York. No slight difficulties attended the transport from Laas, via Meran, to the wharf at Venice, whence the monument was shipped for America. The central figure of the Lorely alone weighs twenty-two tons, and the three personifications of Satire, Lyric Poetry, and World-weariness, grouped around the shell-shaped basin of the fountain, are of colossal size. The water of the Lorely spring is discharged from the throats of three dolphins. Heine himself appears only on the front of the

pedestal, his laurel-crowned bust being carved in flat relief, and presenting, it is said, a striking likeness of the poet. Professor Ernst Herter supplied the design and clay models of the entire work.

DURING the progress of work upon a new church which is being erected by Mr. E. C. Jordan, at Crindau, Newport, a remarkable discovery was made. The masons were sawing through a piece of Bath stone from Corsham quarries, near Bath, when they came upon a small cavity lined with spar. Such cavities are not unusual, but the surprise of the workmen can naturally be imagined when it was found that inside were six bees. Mr. C. E. Page, architect, who is in charge of the work for Messrs. Graham, Hitchcox and Co., carefully examined the stone, but there was no entrance to the cavity before the saw cut into it, the piece the mason was working upon and the large block from which it was cut being perfectly sound all round, and the presence of the bees is a mystery. They were alive, and two of them were still quite active when taken to a local newspaper office in a small box by Mr. Page. Being on the spot when the discovery was made, he at once captured the bees and secured the block of stone as a curiosity, and has handed over the stone and some of the bees to the local museum.

VERY unfavourable reports (says the Times Zurich correspondent) were in circulation some years ago about the condition of Thorwaldsen's famous monument, the Lion of Lucerne. A commission of experts was appointed to make a full report as to the damage which the grotto and monument had already suffered from frost, rain, and natural decay, and certain measures of repair and protection were then adopted. It is now, unfortunately, the case that, owing to the excessive rains of the past year, the monument has been much injured, and shows serious signs of cracking and crumbling away in many parts of its structure. The injury is chiefly due to the action of water trickling through the living rock out of which the lion is carved, and the experts have decided that the figure and its background must be completely isolated from the main body of sandstone cliff, and that an extensive draining and drying of the rocky surroundings must also be carried out, so that the progressive decay of the monument may be reduced to a minimum. These works are already in progress. Thorwaldsen's memorial to the memory of the Swiss guards, slain in defence of the Tuileries, on August 10th, 1792, was modelled in Rome, and the execution of the work was intrusted in 1821 to a Swiss artist, M. Lucas Ahorn, of Constance.

ONE of the attractions of the Fine Arts Section of the forthcoming Paris Exhibition will be the new statue of Victor Hugo, which M. Ernest Barrias, the eminent sculptor, has begun. It is not Victor Hugo in his later years that the sculptor will exhibit, but Victor Hugo young and bold, his face framed with long hair. The figure will be seated on a rock in a pensive mood, one hand supporting the chin. On the four sides of the plinth will be figures representing epic and lyrical poetry, the drama, and satire. Parisians are taking great interest in this statue, which, it is expected, will be the best that M. Barrias has executed.

It was expected that the frescoes of Chasserain, ornamenting the walls around the great staircase of the Cour des Comptes, on the Quai d'Orsay, could be easily taken off and preserved. This is, however, doubtful, but the Orleans railway directors are ready to give the Fine Arts Department every facility for trying to preserve the paintings, or, at least, part of them. If the Government, however, does not see its way to removing the frescoes, it is probable that the matter will be taken in hand by a private committee. A decision will have to be speedily come to on the subject, for the demolitions are continuing, and cannot be delayed, as the new terminus of the Orleans Company, which is to be raised on the site of the Cour des Comptes, must be completed within a given period.

OSBORNE HOUSE and the adjacent grounds, covering some 800 acres, was purchased by Her Majesty in 1844, but as the mansion was found to be totally inadequate to the requirements of the Queen, her household, and a rapidly increasing family, it was pulled down, and three months later Her Majesty and Prince Albert laid the first stone of the present building. The Prince himself planned and designed the house, which took six years to complete. Since that time, however, Osborne House and its environs have been considerably enlarged. A new wing, the wonderful Indian room (upon the decoration of which no less than £25,000 has been expended) and the private chapel, or prayer room, as it is called, have been added to the mansion itself, while the manor and farms of Barton, various cottages with their grounds, and much woodland, have increased Her Majesty's holding in the Isle of Wight to 5000 acres. The house of freestone is of an Italian style of Architecture, judiciously modified to the exigencies of an English climate. It is of pleasantly varied elevation, and has many wings and façades, which lend to the building an air of light picturesqueness. The Queen's entrance is less imposing than that at Windsor, and scarcely so picturesque as that at Balmoral. It lies in a sheltered nook, and before it is a great granite-edged circle filled with heather from the Scottish moors.

THE Coliseum at Chicago, which was burnt down recently, was one of the largest buildings in the world, covering five and a half acres, and had a seating capacity of 25,000. It was 700ft. long and 300ft. wide, and occupied the ground bounded by Sixty-second and Sixty-third Streets and Grace Avenue and the Illinois Central tracks, almost at the entrance to Jackson Park. The building had room for 100 yards straightaway course and a quarter-mile bicycle track, and the interior embraced 285,000 square feet. The trusses which supported the roof covered 215ft. at their base, and the roof was 100ft. from the ground. The building was supposed to be reasonably fire-proof, as it was mainly built of glass, iron, and steel. It cost £60,000 to erect, and was owned by the Chicago Exhibition Company. In the early part of 1896, when nearly completed, it was blown down by a heavy wind.

THE vacant space in the decorative scheme of the ornamentation of the famous west front of the Doge's Palace, in Vienna, has at last been filled up by a representation of the original statuary. This monument, which consisted of a figure of the Doge Gritti, together with a winged lion proper to St. Mark, the Patron Saint of Venice, was torn down and destroyed by the populace during the rioting which accompanied the fall of the Venetian Republic. For nearly 100 years the inhabitants of Venice have petitioned the various Governments to restore the lost statuary, and at last their perseverance has been rewarded. Two years ago the Italian Government opened a competition among native artists and offered a prize for the best reproduction of the missing monument. The prize was won and the work executed by the young Venetian sculptor, Urbano Bottasso. This colossal piece of alto-relievo sculpture, executed in Istrian marble, is about 11ft. long. It represents the traditional lion of St. Mark with his paw resting on the open Bible; opposite him kneels the Doge Gritti, draped in the Ducal mantle and holding an inscribed banderole in his hand. The work was to have been completed by February, 1899, but such was the zeal of the young sculptor that the monument was finished more than a year before the stipulated time. Recently the huge and heavy alto-relievo was raised to its place and fixed on the cornice over the balcony opening, in which the Doges of old used to appear before the populace at special times and seasons. The erection of the symbolic statue was to have been inaugurated recently, but a strong and general desire was expressed that the ceremony should be postponed until March 22 next, which will be the anniversary of, and coincide with, the jubilee

festivities which will be held in order to celebrate the Revolution which gave freedom to Venice. This piece of sculpture gives yet an added interest to the unique building which records the history and forms one of the chief glories of the City of the Sea.

WITH regard to the proposed restoration of the parish church of St. George's, Douglas, the vicar writes: The committee's architect, Mr. James Cowle, is preparing further plans. The old walls have been examined by one of the leading builders in the town, and he thoroughly agrees with the architect, that they are not worth keeping, and that nothing could be done to them to render them fit, architecturally or otherwise, for the thorough restoration of the internal part of the church. At present we must simply be content to wait; and, meanwhile, get all the information we can from those who are competent to give it, so that when the time comes for making a decision as to what must be done, we may do so with full knowledge.

ONE of the most extensive operations undertaken of late years by the London and North Western Railway Company is now in progress at Crewe. It will involve the outlay of upwards of half a million of money. On completion of the alterations, Crewe railway station will embrace 223 acres; its platforms will be upwards of 4000 lineal yards in extent, just double the present length; the area of the roofed-in portion will be 40,000 square yards, instead of 12,160 square yards; and its sidings will be augmented in number from 140 to 220, with a total length of thirty miles, in place of 15½ miles. By the additions to Crewe, without reckoning the extensive area of the locomotive works, the length of the station from north to south will be 2½ miles, forming a strip of about half a mile in breadth. Provision will have to be made for a great many other departments, and additional barrack accommodation for the enginemen and brakemen away from home has been arranged. As regards the station itself, there will not be any pulling-down, but a considerable addition. What will be provided will be three up and three down platforms, and four improved bays. Access to the platforms will be, as heretofore, by inclined corridors from the Nantwich road, which was widened by Mr. Footner in 1875, but there are to be extra bridges for passengers to cross from one side to the other at different parts of the station, and, needless to add, waiting and refreshment rooms are to be erected, together with such conveniences as hydraulic luggage lifts.

THE French Government has just concluded the purchase of the mansion in Knightsbridge which has for so many years sheltered the French Embassy. The price paid is a little over £25,000. It is a fine house, containing some very large rooms, and possesses a magnificent terrace overlooking Hyde Park. The French Embassy is one of the two great mansions which were built on either side of Albert Gate by the late Mr. Thomas Cubitt. They were so large that in the early forties they were humorously called "The Two Gibralters," because nobody believed that they ever could or would be "taken."

THE new aseptic room at the Temperance Hospital, Hampstead Road, is a comparatively small apartment, 14ft. by 11ft., and 13ft. high, but it is a model of lightness and cleanliness, with modulated warmth and scientific ventilation. Designed by Dr. Collins, surgeon of the hospital, and chairman of the London County Council, the ward is walled with enamelled glass tiles of very pale pink, floored with marble mosaic, lighted through a large single sheet of plate glass, which constitutes one-fifth of the west wall, and is warmed by a Teale grate below the window. The bed, furniture, fittings, and surgical apparatus are all in the newest style, glass being largely employed. The plans were prepared by Mr. Tregellen, and the building erected by Messrs. Holloway. The total cost is estimated at £500.

GENIUS IN ARCHITECTURE.*

BY PROFESSOR GEORGE AITCHISON, R.A.

IT has been the custom for the President to say a few words to those who have just entered on the study of Architecture, and it is one of the most grateful tasks that he has to do, for he can look forward to those happy times when some of you aspirants may have conferred an inestimable boon on your country by designing monuments that will delight your contemporaries, and may be hereafter the admiration of the world. Speaking personally, it is the student's welfare that I have most at heart, not only because I see how many of my own youthful days were wasted from having no proper direction, but also because it is the one feature in all architectural epochs over which the elders can have the greatest influence. At present we know not how to produce genius, nor how to turn the public mind to desire and take an interest in

NOBLE ARCHITECTURE.

We have abolished symbolism, so that the bulk of buildings do not tell their tale, and the public are ignorant of what is being done for them. In the triumphal arches of the Romans, a goddess leaning on a wheel told the public that the Emperor made roads. If any statesman knew his business, every good sculptor in the kingdom would be fully employed in sculpturing buildings to tell the poor what was done for them; how they were taught, cured, looked after in their old age, and in their sickness and infirmities; and how law and order, peace and industry, were being taught to the savages who surround our Empire. It is in the interest of the students, and the Art, that I have proposed to omit from the examinations all that is not purely architectural, for this now shuts out those who have not received a good general schooling. We do not want to shut out a genius, not even a resolute and determined worker, because he has not learnt Greek, Latin, French, or German. I do not suppose Raphael had much schooling when he was taught to draw at three years old, and yet he not only became the greatest painter of modern times, but a sculptor, and an architect too. We are not surprised that a man with

SUCH INVENTIVE GENIUS AS RAPHAEL

should become skilful as an architectural designer when he had learnt the elements of Architecture; but it is surprising that he should have been one of the great constructors of his age, for you must recollect that Bramante, on his death-bed, recommended him to the post of head architect to St. Peter's. I do not suppose that Palladio had much schooling when he was but a mason's boy, nor our own Ware when he was a chimney sweep. I have devoted twenty years in trying to gain an insight into the causes of the great architectural epochs of Europe, and this is the conclusion I have come to. They seem to me to result from the set of the public mind towards enriching its age with monuments which embody the general aspirations. To accomplish this there must be hoarded wealth, noble desires, and architectural judgment. There must be, too, those endowed with the genius to express those aspirations architecturally, and highly skilled craftsmen to carry them out. As far as I can judge, genius is the power of invention, and is mostly accompanied by that high general capacity we call talent. This heavenly gift of genius and this general capacity are, however, only the raw material which has to be worked up. Genius has not only to learn what is necessary to express its conceptions, but to strive to do its best. Architecture is a structural Art; and therefore

THE ART OF CONSTRUCTION

is the most necessary thing to be known. The science of construction is statics; consequently the elements of statics must be known. A knowledge of statics, too, gives us a true ratio between every part of a structure,

and it gives the real shape that each part must take; if we were as clever as Nature, it would in all probability give us a beautiful shape. Unfortunately, we are far from being so clever, and consequently we have to learn by other means how a beautiful shape can be made out of the necessary shape. For this purpose we must study deceased Architecture and Nature. Every piece of deceased Architecture that we admire can be made to show us the æsthetic laws that govern it and produce its excellence, and these laws are as capable of being employed now as then. Every important portion of an ancient building may have the reason extorted from it as to why it pleased at its creation, and pleases us now; but from our greater knowledge, and from the necessity of using other materials, we may see that the proportions then used are not now applicable: for instance, a Greek Doric column showed the statical knowledge of its day, but it certainly does not now. Our materials and climate are different; the emotion now wanted is probably different, and the æsthetic sentiment of our day is probably different too; so we must get some of our

HINTS AND SOLUTIONS FROM NATURE'S WORKS.

There are, in the first place, human beings and animals, and there are thousands of different sorts of trees, of leaves, of grasses, of buds and fruits, which have beauty in different degrees, and we should learn from these how the beauty we want can be attained by various shapes and various proportions. Without the gifts of the mathematical and the artistic capacities no man should become an architect. But there is another requirement which we call planning—that is, how to make each room, hall, passage, and staircase answer its purpose, and how to pack them in the most convenient way. This may be called common planning; but there is artistic planning as well, which is the choice of forms which are not only appropriate for use, but are agreeable to the eye. I would by no means discourage anyone who loves Architecture and will study it from being an architect, for there are various degrees of power and excellence in architectural works, all of which make up

THE REALM OF ARCHITECTURE.

We do not despise the violet because it is not so grand or so lasting as the oak. The smallest cottage, if perfectly arranged, perfectly constructed, and perfectly proportioned, may be as delightful to contemplate as the mansion, the palace, the town hall, or the cathedral, though it does not require the same knowledge, the same daring, and the same invention. You must bear in mind that nothing great is reached in the fine arts without simplicity, but lovely simplicity is reached by great labour, and takes about ten times as long to arrive at as ornateness. "Oh! what a power has white simplicity!" Just now there is a great inclination to get effects by exaggeration, or by ways that involve little thought or trouble, such as by the distortion of the Orders, the sticking on of bits of rustication all over a building, or by putting water-gates into the attics of buildings. We must not forget the proverb that "the human mind is greedy of novelty," so much deplored by William Morris and by Mr. Ruskin, though

THE DESIRE FOR NOVELTY

is natural to man, and cannot be overlooked nor overcome; for each generation has not the same knowledge nor desires as the preceding one. In eating, the most delicious food soon palls, hence the proverb of "Nothing but eel-pie." Let us, instead of deploring the taste for novelty, echo Tennyson's words: "Let the great world spin for ever down the ringing grooves of change." True novelty is obtained by development. We see how Nature develops her types; and if we had lived in the palmy days of Greece we should have seen how the young clothopper was developed into grace and beauty by training. It is rather nauseous and rather ridiculous to hear so much talked of a new style, particularly when it is supposed that a clever man can invent it. The real new

style is to be attained by the improvements that come about by the altering of proportions through our greater knowledge of statics and the strength of materials, by making our buildings perfectly suitable to the new requirements of our age, by the suiting of our mouldings to the climate, by the greater cultivation of outline, and by a deeper knowledge of our own light and shade. The hideousness and ignobleness of our clothes render contemporary sculpture impossible. We have not even arrived at what the Italians call "handsome ugliness," and we have, when the present is represented, to confine ourselves to the brutes and to vegetation. Though I fear that what I am about to say may seem not a twice-told tale, but one that has been told many times in each generation, it cannot be too often impressed on the young. Men cannot always judge of what they are capable, so that if a student loves the Art sincerely, but appears to have no capacity for it, he cannot be sure of this; his capacity may require much cultivation, and if he woos the Art in season and out of season he may find he has it. Etty, the Royal Academician, who eventually painted flesh so admirably, was the butt of his fellow-students; but by resolutely pursuing his labours and never losing a moment he became excellent at his Art after some twenty or thirty years of unremitting study. Moderate your wants, and be contented with the poor pecuniary rewards your industry can attain. Your ambition should be to create

SOMETHING THAT WILL CHARM AND ELEVATE

your fellow-men through centuries. Those who look for money as the main thing, should be surveyors or valuers. Nor am I going to treat Architecture as a thing to be done in broken time, nor to look on it, as it is mostly looked on now, as a lower branch of the knowledge of the value of land and the price of bricks; nor as an antiquarian revival; but as a creation of the true and the beautiful as understood and felt in our own day. I mainly address myself to those who have the ambition to be poets in marble, stone, brick, iron, and wood, who desire to endow their country with a building that may rival the Parthenon, the Erechtheum, the Propylæum, or the Choragic Monument; the Pantheon of Rome, or with one that may vie with the interior of St. Sophia and St. Mark's, with the Scuola di San Marco, with the Cornaro-Spinelli Palace, or with the Town Hall of Brescia. Think of Milton, who got the price of waste-paper for his "Paradise Lost," but who "made himself an everlasting name." In some of the fine arts the mere exercise of them is its own reward. In the concord of sweet sounds this is certainly the case, and why should not

THE CREATION OF THE TRUE AND BEAUTIFUL IN ARCHITECTURE

be its own reward? There have been those great and pure souls that ask for nothing, but were contented to help and raise their fellows without even a thought of fame. Surely such exist among us? Cannot some of us be content to endow our country with a priceless treasure, with a monument that all mankind must admire and be thankful for, without an afterthought of fortune or fame? Do we not admire and revere the architect of the Pantheon at Rome, though his name is still unknown? It is only lately that the name of Formentone was known as the architect of the Town Hall of Brescia. Have we not Socrates; that soldier who perished unknown in the sentry box at Pompeii, and Marcus Aurelius as examples? and surely there must have been thousands who have only sought to do their duty, and there must be thousands still. We have at least an example of one great Englishman of perfect courage and perfect benevolence—Gordon. Let us hope that as great a soul may be found amongst our own students.

At the above meeting, on the proposition of Professor Roger Smith, the hearty congratulations of the R.I.B.A. were conveyed to Professor Aitchison on his election as a Royal Academician.

* An address delivered to the R.I.B.A. students, at the distribution of awards, on Monday night.

COMPOSITION IN REGARD TO PUBLIC BUILDINGS.*

By F. T. BAGGALLAY.

(Continued from page 520.)

FOR the sake of unity and concentration the main tower or other principal feature should be single, and not duplicated or further multiplied. If it is necessary to have more than one tower, for instance, or even broken-up roofs, still, some one thing should be large enough, and more especially high enough, to dominate the rest; and in such cases it is more than ever necessary to put it well in the middle. So much was said about the angles and end features of buildings in a paper that I had the honour of reading to the Architectural Association some years ago, that it would be but repetition to dwell much on that part of the subject now. When seen in perspective,

THE ANGLES OF A BUILDING

are as much the ends of the group as they are in elevation, though not the same angles, and some feature, or at any rate different treatment, is necessary there to mark the definite termination and completion of the composition; without something of the kind a reason for stopping at that particular point seems to be wanting. In any extensive building, rectangular in plan, the sides of which recede from the spectator when seen in perspective, giving long lines running away down towards the horizon, something more than a mere angle, a pier or quoins will generally be wanted at the ends of the composition, or a little within them, to break such lines and, as it were, lift them up. It is better for the general contour of the group if such features are not at, but within the actual ends. They may even be the middle features of short fronts. The great thing is that they must break the lines; they must rise above the skyline and their vertical lines ought to be higher than the cornice or finish of the walls generally, although the cornice may, and indeed should, as a rule, break round them. The necessity for carrying up

THE VERTICAL LINES

of these features is often overlooked with unfortunate results, as in the case of the buildings of the Louvre before referred to. Great care should, however, be taken that these secondary features do not compete with the main central one for attention. They should be smaller in every way, but especially they should be lower; and to get the best result they should be entirely different in design. The hen and chickens arrangement of a great dome and several little domes, or a great tower or spire and smaller echoes of it, is always less satisfactory than a group in which there is no suspicion of an attempt on the part of the secondary features to ape the principal one. There should also be a very restricted limit to the number of these secondary features; or at any rate neither the same design nor even the same general outline and proportions must be repeated too often, and never repeated in features which occupy different situations in the composition. Such repetition leads to both redundancy and the most poverty-stricken kind of monotony. In buildings like

THE GOTHIC CATHEDRALS,

in which the horizontal lines radiate from the centre, and consequently, when seen in perspective, run up instead of down, I do not think that any secondary features to break them are required. A little turret or group of buttresses to stop the composition seems sufficient. It may appear a rather daring thing to say, but the western towers of cathedrals in most cases seem to me a mistake. They are generally far too large in scale, and too similar in form to the main central tower, to group well with it; and they are at one extremity of the composition, in most views, balancing, if

one can call it balancing, nothing at the other end; which, indeed, where there is an apse, is sloping downwards in a very undignified way. The Romanesque architects, in this respect, managed better, generally getting towers or turrets at both ends. Perhaps, where there is an unusually long nave, something smaller than towers, not placed at the extreme end, but a little way from it—say, another transept—would have been an advantage; but Salisbury has not anything, and, even apart from its size, it is a far more pleasing composition than Lichfield, with its three spires. Western towers, with nothing large enough over the crossing to hold their own are a gigantic mistake, of which Cologne Cathedral is the typical example.

THE BREAKING UP OF SKY-LINES

is a thing that has often been recommended; but while it is, as before remarked, generally necessary to break a long one upwards or stop it at the end, to break it by a drop or cut through it is a thing to be avoided at almost any cost, and to do so for choice is to make a very serious mistake. It is still worse to break through a main cornice. These lines are perhaps the most important in a composition. They are wanted to hold it together, and give it unity and strength, and to cut through them is like cutting the cords of a bundle of sticks, and allowing it to fall to pieces. The Fine Art Museum at Lille has this fault in an astonishing degree for a building that is admirably designed in almost every other respect, and detailed with a skill that few of us could equal. It really looks as if it wanted a chain or cable round the top to prevent its falling apart. After solidity and unity,

ONE OF THE MOST IMPORTANT THINGS

to be seen to is character; and one of the chief elements in character is scale. Small parts tend to delicacy and prettiness, large ones to strength and grandeur. Small parts are supposed to make a building look large, and large parts to make it look small; but the influence of scale in that respect is probably greatly overrated. A man near, or any object the size of which is familiar—trees and surrounding buildings, and so on—give to the eye a just impression of scale which no exaggeration, in either direction, of the details of the building itself can do very much to remove. The attempt to give an impression of size by this means is supposed to be not only legitimate, but praiseworthy. But it is after all a species of deception, and one which really defeats its own ends, for there can be no object in trying to exaggerate the size of a building unless it be to produce an impression of grandeur. But small details necessarily suggest delicacy and thinness, qualities absolutely opposed to grandeur. If the smallness be more than is reasonable, or, rather, more than is customary, the structure even begins to look like the model of a larger one. It is of course possible to go too far, and to make details so large that they become coarse and vulgar. But for a public building, or any great architectural work, it is essential to its character that the parts shall be large enough to look exceptionally substantial, to suggest big piers, thick walls, a general massiveness, and, above all, largeness of idea and an avoidance of pettiness.

SUBSTANTIAL CONSTRUCTION

may be suggested without the use of ornamental details by setting the door and window frames back, and showing deep reveals, by the use of large material, by plenty of unbroken wall, and in other ways; but the simplest treatment calls for a little detail of some sort, the scale of which will help to give character, and, in public buildings, should be large. Particularly the projection or relief should be adequate, since it is that which most suggests the existence of plenty of thickness. Thus attached columns, besides being more delicately shaded, and, therefore, more beautiful, are also a far finer treatment than pilasters. Unfortunately, they are also more expensive, and more difficult to deal with, but that is by the way. Whatever the scale is, it is most important to use it consistently. One

used to be told that you must not have two scales side by side, but that is a mistake. There is no harm in having a nave arcade of large arches, and a wall or screen arcade of small ones, nor in using a large order on the walls, and a small one for window dressings. What is

INEXCUSABLE AND DESTRUCTIVE OF HARMONY

is to put a cornice, consisting of a number of small mouldings, on the top of a pier, the cap of which is composed of a few large ones, or to give the nave and screen arcades the same sized mouldings, or, to take a commoner case, put to the same building a block cornice composed of small mouldings, and a plinth of one big one. This is a matter which is not unfrequently overlooked in the sculpture and carved ornaments of a building, even when there is no fault to find with the architectural details. One sees light, delicate carving in low relief lost under large, heavy pediments and cornices, and, on the other hand, great coarse figures supporting or sprawling over mouldings which seem by contrast mere threads. Sculpture, and what is called architectural carving, are generally used to emphasise certain points, or, as it were, to punctuate the composition; and to a certain extent also to cover up awkward lines or spaces, which, by management of their own lines, they can be made to correct or obliterate. But although these uses are legitimate enough, it is most effective in broad masses, such as deep bands and friezes, and particularly, strange as it may seem, in the half lights under cornices, pediments, and the like. Perhaps because it breaks up, and gives richness to the shadows. Attempts to deal definitely with

THE LIGHT AND SHADE ON THE EXTERIOR

of a building meet with little encouragement from the weather in our climate, where, during so much of the time, it is difficult to see the difference between the two, unless the shadow is a very black one; and an architect who depended on them alone would only get his effects for a few hours occasionally. It is, however, a very important subject, and always worth considering. The broader lights and shadows of the masses and breaks in a composition, of course, change in shape as the earth moves round the sun, and at first sight it seems as if it would be too complicated a matter to try to do anything with them. Such is not, however, altogether the case; for a consideration of the fine effect produced by a broad shadow might often influence the depth of a break if the designer thought about it; and if he remembered how beautifully a round surface curves and softens the edges of a shadow cast upon it, he might sometimes be influenced in favour of such a form. It is also true that a lighted surface may be thrown almost entirely into shadow by breaking up the surface, provided the aspect be favourable. But it is in what may be called the incidental shadows that most may be done. Incidental shadows arise from making recesses in lighted surfaces, or in contriving projections from them. The most beautiful of such shadows are generally deep horizontal ones, such as that produced by the little galleries under the eaves of

ROMANESQUE BUILDINGS,

which answers to that under a classic cornice, but is stronger and beautifully enriched by the sparkle of light on the columns. Neither light nor shade, although they should be in broad masses, want to be in quite flat, unbroken ones. If there are a few windows or holes to give black spots, and a few projections, such as mouldings or balconies, in the lighted surface, and different depths of darkness in the shadow, both are richer, and appear stronger. The finest broken shadows are those formed by a covered colonnade, with a wall behind, giving delicately graduated shadows on the columns and a deep one on the wall; such a feature also suggests solidity. But, in criticising the main façade of the Louvre, Mr. Fergusson finds it vexes him, because he assumes (quite gratuitously) that the back wall does not run down to the ground, and he wants to know what it stands on. In interiors the management of light is one of the

* A paper read before the Architectural Association on Friday, Jan. 14.

most important means of obtaining good effect. Instead of trying, as we too often do, to merely get an equal flood of light everywhere, that is precisely what we should try to avoid. Enough, people say, is as good as a feast; and doctors tell us it is much better. And so it is with light; enough is one thing, an all pervading glare quite another. I do not advocate dark corners, which are

A DISGRACE TO ANY ARCHITECT, and only lead to the use of artificial light. There is no credit in doing our work well if we are going to ignore practical conditions. But a contrast of light and shade is as necessary inside as outside, and in this country we can do far more with it inside. A corridor equally lighted throughout its length is perfectly uninteresting, though the light be from the side or the top; but one which is crossed by a broad patch of light that increases the obscurity of the comparative shadow beyond is interesting at once. A definite light from one side, or from above, casts shadows, and gives form to objects, whereas an equal light all round casts no shadow, and destroys form and distance. The worst light is one directly in the spectator's eye; not only is it physically annoying, but it shows everything in equal shadow. The best light is often said to be a top light which throws all the upper part of the apartment into shade, and lights the floor and lower part of the walls. But light high up in the walls which lights the ceiling, and leaves the lower parts in comparative shadow, is even better. The now

COMMON PRACTICE

of putting electric lights close up to a modelled ceiling, throwing a grey shadow over the ceiling, but bathing everything else in a flood of light, is really a terrible arrangement. In internal effects generally we are at the present time, in our public buildings, immeasurably behind the architects of other ages, and even of our contemporaries in other countries. Any attempt, for instance, at a really fine staircase such as is usual in the public buildings of France or Germany, or at a spacious hall, almost always frightens people if it is made. And it is seldom made, because ninety-nine out of a hundred of our public buildings are the result of competitions in which architects are asked for an amount of accommodation which can only just be provided, if it can be provided at all for the cost. Although it is sometimes stated that corridors and staircases are to be ample, everyone knows that what would be considered the minimum in France would be regarded as sinful waste in England.

DECORATIVE PAINTING AND SCULPTURE are in much the same case. A proposal to employ an artist of eminence for such work, as is always done abroad, generally causes an architect to be looked upon as a candidate for Earlswood. If he names an adequate amount as the cost of getting such work properly done, he is often told that he does not know his business; that the local decorator or carver only charges so and so; and unless he is a very strong man, or a very subtle one, all his labour in composing his building will be often lost at the last moment by its being spoilt with vulgar ornament, to gratify the parsimonious instincts of a public body which, unfortunately, can quote the Government of the country as an example. I have only been able to touch on a few prominent points of my subject. It would be as easy to measure the universe with a two-foot rule as to put the Art of architectural composition into a few pages of foolscap. Such matters as emphasising vertical or horizontal lines, or emphasising or suppressing both, to give expression or character to a composition, the subject of proportions generally, and many other things will, I hope, be touched on by others.

PERSONALTY to the declared value of £310,644 13s. 9d. gross, and £309,483 8s. 4d. net, has been returned under the will of the late Sir Henry Doulton.

Six new sheds are being built at Dundee Harbour for the storage of jute. They are to be constructed of galvanised corrugated iron, with steel ribs, and the party walls will be of rubble masonry. Each shed will accommodate upwards of 5000 bales.

KEYSTONES.

MR. GEORGE ALLEN has arranged to publish a cheap edition of Ruskin's "Stones of Venice." EXTENSIVE structural alterations are to be made at the Liverpool Town Hall. The work is expected to occupy about two months.

THE restoration of Bishopsgate Street Chapel, one of the oldest Congregational churches in the City of London, has been completed.

THE Manchester City Council has adopted a recommendation to apply to the Local Government Board for a loan to carry out an extensive scheme of municipal lodging-houses.

THE Council of the Sanitary Institute has accepted an invitation from the Lord Mayor and City Council of Birmingham to hold its seventeenth congress and exhibition in that city in September next.

It is widely rumoured in the district that the decree has gone forth for the abandonment of Cyfarthfa Castle. The report is that in a very short time the place will be cleared of the scant furniture remaining, and boarded up and deserted.

EXTENSIVE additions and improvements have been made to the Guest Hospital building, Dudley, consisting of a new ward, capable of accommodating thirty-one patients, together with two special wards, an operating-room, &c. The total cost of the alterations was £4500.

THE London County Council will, it is anticipated, hold a special meeting early in February to consider whether or not to veto the proposal that the registration of title on the sale of land under the Land Transfer Act, 1897, should be made compulsory in the County of London.

CONSIDERABLE progress is being made with the extensive alterations that are being carried out at the Brighton Town Hall by Messrs. Field and Co. The rate offices and the east front are now practically finished, and the new police court is engaging attention at the present time.

AN inquiry has been held at Brighton as to the application made by the Town Council to the Local Government Board for sanction to borrow the sums of £5468 for the purposes of sewerage, £2480 in respect of a refuse destructor, and £312 for the Hollingdean storeyard.

STROMNESS Harbour Commissioners have accepted tenders for part of the pier extension authorised by the New Harbour Act of last year. The present work consists of an extension of the Warehouse Pier in greenheart timber and stone work, between the Warehouse and Murray's Pier, the total cost being about £1600.

STEYNING PARISH CHURCH, Sussex, has been under repair. The organ chamber has been re-roofed, the west and south sides of the tower have been pointed, and the windows on the south side have been replaced. The old Norman windows have been most carefully and skilfully pointed, besides other work. In the spring it is hoped to commence further work of repair.

THE latest report on the progress of the Jungfrau Railway shows that the work of construction is being well pushed forward. The principal tunnel has been carried to a distance of 164yds. by hand boring—chiefly done by Italian workmen—and the preliminaries for tracing out the great tunnel have been accomplished after some two years of labour. The rock is found to be excellently adapted for tunnelling, and experiments on the Jungfraujoch have proved that it is reached at a depth varying from 80ft. to 100ft. under the snow, instead of at 230ft., as was at first expected.

It has been definitely decided by the directors of the Vale of Glamorgan Railway Company to at once proceed to replace the sunken pillar and the several archways of the Porthkerry Viaduct affected by the recent subsidence. The remaining pillars will be supported during the progress of the work by wooden supports, held by iron stanchions, and the foundations will be both deepened and strengthened, and the pillar itself and the whole structure towards the Barry end be rendered absolutely secure from any recurrence of the present mishap.

Professional Items.

BOOTLE.—The new parochial hall adjoining St. Matthew's Church, Bootle, provides one large hall, capable of containing nearly 400 persons, which is lofty, well lighted, and ventilated. A spacious corridor connects the hall with the church. The staircase from the entrance hall leads to a balcony projected into the large hall, and to a large young men's room on the first floor, which is well adapted for club purposes, and will give the chief access to the large entertainment hall above. The subsidiary entrance is in communication with a kitchen on the ground floor. The plans were drawn out by the late Mr. Charles Aldridge. Mr. Ernest Aldridge has carried out the work under the superintendence of Messrs. Willink and Thicknesse, of 14, Castle Street, Liverpool. The contractors for the whole work are Messrs. George Woods and Son.

BOSTON.—The chapel in West Street, Boston, which was destroyed by fire on January 27th, 1897, has been rebuilt and renovated at a cost of about £2000. Mr. W. Greenfield's contract for the brickwork, &c., was £510, and that of Mr. Jessop for the woodwork, £900. Messrs. Hewitt, of Leicester, supplied the new organ at a cost of £250. The architects were Messrs. Howdill, of Leeds.

CARDIFF.—The completion and opening of one of the largest dry dock undertakings in England has just taken place at Cardiff. About two years ago the Cardiff Channel Dry Dock and Pontoon Company acquired the site, and the contract was entered into with the firm of contractors, Messrs. S. Pearson and Co., of Westminster, who are also building the Port Talbot Docks, to construct a graving dock commensurate in size with the growing needs of the port and the increasing dimensions of steamers now frequently coming to the Bristol Channel. This new dry dock is over 620ft. long and 107ft. wide, with a width of entrance of 62ft. 6in. It will have a sufficient depth of water on the sill to dock the largest of steamers on the lowest of neap tides. The entrance locks are closed in a manner new to Cardiff graving docks—i.e., by a sliding caisson, built by Messrs. Finch and Co., of Chepstow, which is worked by its own engines. By this means the dock can be opened or closed in two or three minutes. For the centre of the dock another caisson is being built by Messrs. Swan and Hunter, of Wallsend, the full width of the dock, for the purpose of dividing it into two parts. The placing of this centre caisson can be varied to suit the different length of ships in the dock, arrangements being made to shift the same in either of two positions at distances of 40ft. The dock, when full on the highest spring tide, will contain about 15,000,000 gallons of water, but the pumps by Messrs. Gwynne and Co., used in connection with Babcock and Wilcox patent water-tube boilers, are of such capacity that the whole of this vast quantity of water can be displaced in less than three hours.

DUNDEE.—Operations in connection with the new hotel to be erected at Whitehall Crescent have begun. The temporary buildings occupying a portion of the site have been demolished, as well as a tenement which abutted on the Gilfillan.—In all departments the work in connection with the new Post Office in Dundee is now well advanced. Externally the building is practically completed, the only work yet remaining to be done being part of the sculptural decorations; and internally, it is in the hands of joiners and plasterers, both of whom are making rapid progress. Among the most recently-finished sections is the sorting-room, a large, airy department, oblong in shape and lighted by four rows of roof lights and a row of windows in the north wall.

EAST GRINSTEAD.—The recently-opened sanatorium consists of an administrative block and two ward blocks. The administrative

block has a red brick front with stone quoins, and is weather tiled. The two ward blocks are plainly built with stock bricks with red brick facings, and have slate roofs. The floors are of wood blocks, and the windows are carried up to within six inches of the ceiling, and are made to open, thus permitting of an abundance of air. The ward blocks each consist of two wards and a nurses' duty room. Such necessities as a laundry and an ambulance house have also been provided, as well as Thresh's current steam disinfecter. The whole work has been carried out under the supervision of the surveyor, Mr. Ralph Wilds.

FOLLA RULE.—The Church of St. George, Folla Rule, Rothenorman, has undergone considerable alteration and improvement. The alterations just completed embrace the extension of the chancel to about double the original size, the addition of a north aisle, vestry, organ-chamber, heating chamber, &c., a new entrance-porch and bell-tower at the south-west corner of the building, and the entire renovation of the interior, including new floor and ceiling, re-seating throughout, the introduction of new heating apparatus and improved lighting and ventilation. The aisle is divided from the nave by four bays of semi-circular stone arches supported by stone pillars, circular and plain, and having splayed bases and moulded capitals. The entrance doorway has a semi-circular moulded arch, with label moulding over and small detached pillars with moulded caps and bases, and in the belfry stage of the tower are introduced four double-recessed, arch-headed, louvred openings, one on each side. The tower has a slated roof, terminating in a gilded weather-vane and finial about 70ft. above the ground level. The new ceiling of the nave is in the form of a flat segmental arch, relieved with plaster rib-mouldings, which divide the ceiling longitudinally into four bays corresponding with the bays formed by the aisle arches already referred to. The stone altar and the east window—the latter stained glass, by Messrs. Clayton and Bell, London—were presented to the church. The plans were prepared by Mr. Arthur Clyne, architect, Aberdeen. The contractors for the various departments were as follows:—Mason work, Mr. Lauder, Inverurie; carpenter work, Mr. Watt, do.; plaster work, Mr. Moir, do.; plumber and slater works, Mr. Pirie, Fyvie; painter and glazier work, Messrs. Donald and Sons, Aberdeen; heating apparatus, Messrs. Rae and Sons, Inverurie.

FORFAR.—The new Post Office, Forfar, has a frontage to Castle Street of about 40ft., and extends back about 116ft. On the street floor is the public office (20ft. by 20ft.), and behind it are the Postmaster's rooms and sorting office. The latter will be 42ft. long by 24ft. in breadth. At the end of the sorting office are the postmens' and clerks' retiring rooms, with necessary lavatory accommodation. At the rear of the building the telegraph lineman's room and battery room are situated, together with the barrow shed and basket store. On the first floor are the telegraph instrument room (20ft. by 16ft.), telephone room (12ft. by 11ft.), and boy messengers' room. Mr. David Adamson, Yeaman Street, Forfar, is the principal contractor.

GARSTON.—Two new schools—the Grassendale Victoria Schools (Church of England) and the Wesleyan Day and Sunday School—have just been built at Garston. The Church School is a two-story building, substantially built and fireproof, and affords accommodation for 450 scholars. The Wesleyan Schools are all on the ground floor, and afford accommodation for 339 scholars in three departments.

GLASGOW.—The memorial stone of the new Gorbals Free Church, Glasgow, has been laid. The new building is planned in a central position on the eastern side of Portland Street, South Side. Its erection on such a site—jammed in between two four-story tenements—presented unusual difficulties in plan and design. These have been dealt with by occupying the whole frontage block with the entrances, hall, and rooms, while the church is

placed behind these, extending to the lane and lighted on each side. The stonework is of red sandstone from Gatelawbridge quarries. The following are the principal contractors:—Mason, W. Gordon and Co.; wright, A. Meiklejohn; slater, A. Gibbons; plastering, Hamilton and Co.; iron and steel work, R. Stoffert; plumber, W. Anderson; gasfitter, Paterson and Co.; glazier, Meikle and Son; painter, J. L. Duncan. The estimated total cost is £6500. The architect is Mr. John B. Wilson, Glasgow.

HALIFAX.—The Watch Committee of the Halifax Corporation, subject to confirmation by the Town Council, have accepted the tenders required in the erection of the new police station, court house, &c., on the old infirmary site. The tenders amount altogether to about £12,600. The principal tenders accepted are those of Messrs. Charnock and Sons for the masons' and joiners' work, and Mr. T. Boocock for plumbing, &c. The only material alteration from the original plans is that the height of the lower rooms is to be 13ft. 6in., instead of 11ft. 6in. This increases the cost by about £600.

HECKMONDWIKE.—The new Board Schools, which have been erected in High Street, Heckmondwike, have cost about £14,000. The arrangements throughout are on the most modern principles, and include provision for an organised science school. The central hall is surrounded by sixteen class-rooms, in addition to which there are physical and chemical laboratories, cookery and manual instruction rooms, &c. Adjoining the asphalted playground are a caretaker's house and new offices for the Board.

KEIGHLEY.—Messrs. W. and J. B. Bailey, architects, have submitted to the hospital committee plans for the erection of new hospital premises for Keighley and district, and, subject to a few minor modifications, they have been approved. The new premises will be connected with the old by corridors. In the centre will be the new administrative block, three stories in height, and providing rooms for a resident surgeon, a dispensary, a day room, staff room, casualty room, waiting room, office, two nurses' rooms, matron's room, and bedrooms sufficient for twenty-nine persons. At the rear of this will be a building consisting of a large kitchen, scullery, store-room, sewing room, nurses' dining room, and servants' hall. To the south of the administrative block will be a two-story building devoted almost exclusively to ward accommodation, and which will furnish space for forty-four beds. The cost of the scheme, including land, is estimated at from £16,000 to £17,000.

KINGSWOOD.—The Jubilee Clock Tower Committee having decided to make various alterations in the plan for the memorial of the longest reign, a new design has been prepared by the architect, Mr. J. Mackay. It reduces slightly the height of the tower, and it provides that the three dials shall be 5ft. 6in. in width, instead of 3ft. 6in. as first proposed. The tower will be open at the base, so that pedestrians may walk under it; it will be constructed of best brick, with stone facings, and will have an ornamental roof.

LEEDS.—An improvement is about to be made at Ventnor Street Methodist New Connection Sunday school, Leeds. It has been found necessary to take down the existing one-story school, and erect on the site a larger and more commodious building. The main schoolroom, 55ft. by 33ft., will be on the ground floor, and give accommodation for 300. The upper floor will contain six conveniently arranged class-rooms, and a preaching room, 34ft. by 16ft. A wide stone staircase will lead from the ground floor entrance corridor up to the class-rooms. The buildings are to be of brick, with stone dressings. The approximate cost is £1000. The plans have been prepared by Mr. W. S. Braithwaite, architect, 6, South Parade, Leeds.

LIVERPOOL.—The Liverpool Select Vestry has received the special report of the committee appointed to consider the hospital accommodation for the sick and infirm. The report contained the suggestion that, in view of the early utilisation of the Highfield estate, the following general instructions for the guidance of the architects to be consulted should be approved:—“(1) That accommodation should be provided, in the first instance, for 480 patients; (2) that this accommodation should consist of one-storied wards, each containing thirty beds, these wards to be arranged in pairs, so that each pair of wards can be conveniently superintended at night by one nurse; (3) separate bath and closet accommodation to be provided for each ward, and in connection with each pair of wards there should be a patients' sitting-room or kitchen and a linen, &c. store; (4) a nurses' home affording accommodation for superintendent and assistant, thirty-five nurses, and such servants as may be required for the work of the home; (5) in connection with the nurses' home, but separated from it, that the inmates will not necessarily be brought together, accommodation for twenty ward maids or servants to be provided; (6) home or quarters for a resident medical officer; (7) general kitchen and stores, these to be so placed as to be most easily accessible for purposes of service to all parts of the institution; (8) office and receiving rooms; (9) laundry accommodation need not be provided; (10) heating and hot-water arrangements to be specially reported upon by the architects consulted; (11) the whole of the above provision to be concentrated as much as possible, consistently with plenty of space and airing ground to the inmates, leaving available the residue of the land for the accommodation of other classes of paupers. At the same time, the character of the design should be such as to allow of a future extension being made (especially in providing additional wards and in the enlargement of the nurses' and the servants' home), should they be at any time required, without interfering with the general plan of the hospital. Your committee further recommend that competitive designs for such an infirmary as will meet the requirements herein specified be asked for from Mr. E. Kirby and Mr. W. E. Willink, and that a consideration of 50 guineas should be made to each of those gentlemen in respect thereof, such fee, however, not being payable in case either of them should eventually be selected to carry out the work.”—The report was adopted.

LONGTON.—A Local Government Board enquiry has been held respecting an application by the Town Council for sanction to borrow £20,000 for gasworks purposes, and £4075 for street improvements. It was explained by the town clerk that the first-named sum was required in order to extend the gasworks and to put them in a thoroughly efficient state of repair. In regard to the sum of £4075, it was stated that this was required for the purchase of properties for the widening of streets.

LYTHAM.—The foundation-stone of the extensions to the Institute, to form the permanent Jubilee memorial, has been laid. Close upon £1000 has been raised towards the £1500 required to do the work. Mr. George Myers, Lytham, is the contractor, and Mr. Grimble the architect.

PERTH.—For the last nine months the School Board has had under consideration plans for the extension of the Southern District School. Four schemes have been before the Board. The first was estimated to cost £3811, and gives 343 additional places. The second scheme was estimated to cost £2574, and provided 301 additional places. Under the third scheme 311 new places were got at an expenditure of £1777, while the fourth scheme was estimated to cost £1976, and gave 313 new places. Scheme number one, which has been adopted, provides for six new class-rooms, including a new cookery class-room and lavatories, teachers' retiring rooms, and well-lighted central halls.

Under Discussion.

THE WINTER SESSION.

OLD ARCHITECTURE IN LIVERPOOL.

In a recent lecture at Birkenhead, on "Old Architecture in Liverpool," Professor Fred M. Simpson pleaded for the introduction of more artistic construction and ornamentation into modern buildings. He illustrated his remarks with limelight views of Italian palaces, and showed many pictures of eighteenth century houses in Duke Street, Great George Square, and Kent Square, Liverpool, declaring that the latter was one of the best squares in the city. He said houses in those days looked at each other with dignity, and did not shout and jeer across the street at each other, as did so many modern buildings. Dealing with iron-work, he showed views of the handsome gates at Wavertree Hall.

THE TREATMENT OF ARCHITECTURAL PERSPECTIVES.

A general meeting of The Architectural Association of Ireland was held in the Grosvenor Hotel, Dublin. The president delivered a most interesting lecture on the artistic treatment of architectural perspective. He illustrated his remarks by reference to original drawings by Messrs. J. Raffles Davison, C. W. English, J. Coleman, and himself, lent by various architects. The lecturer also showed some etchings, pointing out the error into which many craftsmen fell, that of imitating the methods of the etcher. He also laid stress on the almost invariable neglect of tone in architectural drawing, whereby much work, otherwise of considerable merit, was spoilt.

"SOME POINTS IN PRACTICE."

Before the Glasgow Architectural Association Mr. J. Kennedy Hunter, of Ayr, read a paper on "Some Points in Practice"—the President, Mr. Wm. Tait Conner, in the chair. The lecturer spoke of the relations of the architect to the client, the contractor, and to his fellow architects. He favoured a fixed fee rather than a percentage, though an architect had no option but to grant a certificate to a contractor for work done, less the usual percentage. He objected to architects' guarantees in competitions, preferring an estimate by a skilled measurer, concluding by cautioning the members against accepting responsibility for the clerk of works, who was the client's servant. Mr. W. J. Anderson opened the discussion. Mr. W. F. McGibbon agreed that good architects deserved the standard percentage, but thought the fact that some got half or quarter of that was scandalous.

SANITARY ENGINEERING IN BUILDINGS.

At the monthly meeting of the Sheffield Society of Architects and Surveyors, Mr. W. C. Fenton delivered a lecture on "Sanitary Engineering applied to Buildings." He urged the importance of architects and surveyors carrying out the whole of the sanitary engineering details in connection with buildings and the development of estates. He then mentioned the progress in works of sanitary engineering which had taken place in, and for the benefit of, the inhabitants of Sheffield. The High Street improvement was instanced as a case of sanitary progress, which also afforded architects an opportunity of beautifying the appearance of the town, and in connection with the Crofts improvement, the hope was expressed that the Corporation would give architects an opportunity of dealing with the rebuilding of this extensive area. By the possession of the water supply by the city much needed improvements had been made possible in the construction of w.c.'s and various sanitary fittings, which had also had the salutary effect of reducing the objections formerly raised against them. Mr. Fenton alluded to the unfairness of some drain tests, and said that well laid drains, with good joints, to be subjected to a weight of water

pressure exceeding 2ft. The difficulties experienced by local authorities, architects, and owners, with reference to the burning question of "combined drainage," was dealt with by the lecturer, who had had special opportunities—as previously a Corporation official of long experience—of observing and meeting them. The present system of arranging drainage affected by this question was not satisfactory from a sanitary point of view. The construction of house drainage, size and gradients of pipes, form of inspection chamber, and the materials to be used for same, were described and discussed. The system of "drainage by deflection" was referred to, and its advantages and disadvantages shown. The different varieties of "traps" were described, and the best forms recommended. Some towns were untrapping their drains, and Leeds was referred to in connection with this matter. The proper arrangement of inlets and outlets for the purification and ventilation of the drains was also noted, and their construction explained. Drain pipes and their joints, with proper tests to be employed, were described, and difficulties in connection therewith met.

GLASGOW CATHEDRAL.

The members of the Edinburgh Architectural Association visited Glasgow Cathedral last Saturday. The visit took place on the invitation of Mr. T. L. Watson, who asked the members of the Association to join others interested in a visit to the Cathedral, with the special object of examining the lower church, which was artificially lighted for the occasion. The vaulting of the lower church and choir is in five stages, differing in design and date, and each introducing a different type of vaulting rib. They are as follows:—(1) The south-western compartment of the lower church, A mouldings, end of the twelfth or beginning of the thirteenth century. (2) North and south aisles of lower church, B mouldings, 1230 to 1240. (3) Aisles and chapels of choir or upper church, B mouldings and C mouldings, 1240 to 1250. (4) Middle compartment of lower church, C mouldings and D mouldings, 1250 to 1260. (5) Western stairs to lower church, and the whole or portions of the eastern aisle and chapels, E mouldings, 1260 to 1300.—Mr. T. L. Watson was the leader.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the business meeting of the Royal Institute of British Architects, held on Monday week, the following Associates attending for the first time since their election were formally admitted: Messrs. Percy William Meredith, James Henry Coram, and Ernest William Marshall.—The Chairman announced that Mr. David Ross had been reinstated as Fellow, and Mr. Walter Albert Williams as Associate of the Royal Institute.—The following candidates for membership were elected by show of hands:—As Fellow: Arthur Alderson France, F.S.I. (Leeds). As Hon. Corr. Members: Leopold Eidlitz (New York), Victor Dumortier, President of the Société Centrale of Belgium.—Mr. William Woodward having, in accordance with notice, put certain questions to the Chair respecting the disposition of the guests at the festival dinner on the 2nd ult., the invitations issued to the Press on the occasion, and as to the report in the Journal of speeches made at the function; further, as to on whose authority the plan submitted to the Select Committee on the Government Offices (Appropriation of Sites) by certain members of the Institute was described as "The Institute Plan," replies thereto were given by the Chairman, Hon. Secretary, and Secretary, respectively. The list of awards, which was published in our last issue, was read.

A FINE new post office is to be erected at Preston shortly.

The general, architectural, and other deficiencies of the Scarborough Town Hall have long been a reproach to the municipal authorities. The building is now to undergo further alterations.

Correspondence.

SKIPTON COTTAGE HOSPITAL COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The correspondence on the above matter was copied from your journal into the Craven Herald, and has elicited the following protest:—

"In reference to the correspondence which appeared in our last issue on this subject, we are informed that it altogether misrepresents the facts, and is a great injustice to a body of gentlemen who have conscientiously endeavoured to discharge a very difficult task."

If the facts have been misrepresented I am indeed sorry, but scarcely think this pettish protest enough to satisfy competitors that they have been fairly treated.

For their information generally, and your correspondents, Mr. Marshall and "The Captain," in particular, I may say that my first intimation that the matter was settled was on being asked to inspect the selected drawings, and then I was astonished to see the perspective in question (bearing motto) and the amended plans bearing name of architect. This was about a week before the award was made public. I saw no other competitive plans.

These are hard facts, and it will require a good deal of "conscientious endeavour" to controvert them.

No doubt many of those on the committee are upright, honourable, and generous men, but I fear that the conditions of the competition must not have been made clear to them, or they would not have broken faith with the competitors, and would have disqualified the selected plans.—Yours truly,

VERBATIM ET LITERATIM.

Enquiry Department.

GLOSSARY OF TECHNICAL TERMS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I noticed a book called the "Glossary of Architectural and Building Terms" advertised in the BUILDERS' JOURNAL about two or three months back. I have been unable to see it again advertised. As I desire to buy the book, could you kindly inform me where it is to be had?—Faithfully yours,

W. M.

The work to which you refer is entitled "Glossary of Technical Terms used in Architecture and the Building Trades," by Gavin James Burns, B.Sc., F.S.I. It is published by Messrs. E. and F. N. Spon, of 125, Strand. Price, 3s.

INDENTURES AND AGREEMENTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be thankful if you would give me a copy of the indentures generally given to an apprentice to the joinery trade; also a copy of the agreement generally made between a builder and a general foreman.—Yours very faithfully,

"BYLDAN."

To give a copy of an apprentice's indenture would encroach too much upon the space at our disposal, without being of interest to the majority of our readers. The forms are obtainable from any law stationer in London. The cost will vary according to the amount of the premium paid (if any), the stamp duty being 5s. for every £5 or part of £5. If no premium is to be paid, the stamp duty is 2s. 6d. The form of agreement generally made between a builder and a general foreman is in the majority of cases verbal, a week's notice only on either side being necessary to terminate it. When, however, a written agreement is made between them, the ordinary form as between master and servant is usually adopted, a copy of which can be obtained from any law stationer in London, stamped with a 6d. stamp. If you enquire of the postmaster in your district he will inform you where you can obtain either of these legal forms in your locality.

Trade and Craft.

TO THE SPECULATIVE BUILDER.

A case of importance to builders was before the West London Police Court recently. Charles Arthur Cook, a builder, was summoned by the Acton Urban Council for using bad mortar in the construction of four houses in Colville Road, South Acton.—Mr. Hemsley, who represented the Council, said there were four summonses.—It was stated by the defendant that it was the finest mortar in London.—Mr. D. J. Ebbitt, the surveyor, produced some samples which appeared black, and crumbled to powder between the fingers. The bye-laws of the Council required the mixture of clean sharp sand with lime, and it was stated that the defendants used foundry refuse. It was stated by experts that the use of mortar of that description affected the stability of the buildings.—The defendant said the rain had washed the lime out of the mortar, of which samples were produced. Foundry ashes made good mortar.—Mr. Knightly said foundry ashes crushed mixed with lime would make good mortar, but they were quite different to foundry refuse.—Mr. Rose was of opinion that it was bad mortar, and said the Council were quite right in taking proceedings to prevent the use of it in the construction of houses. He inflicted penalties, with costs, amounting to £7 9s.

THE PILKINGTON PATENT WIRED GLASS.

Much has been said of late upon the question of fireproof construction, but, whilst all due attention appears to have been given to the subject so far as it relates to the erection of walls, floors, roofs, &c., very little has been said concerning windows, which are generally a ready means for the extension of an outbreak. Now that the debate is proceeding, this is an opportune moment to draw notice to an invention of Pilkington Brothers, Ltd., of St. Helen's, Lancashire—a patent wired glass. A sample of the rough plate kind is before us, and certainly it seems to be a novelty possessing valuable features. The glass is manufactured about a quarter of an inch thick and embedded in the centre is wire netting, which gives it quite an artistic appearance, besides, as may be readily imagined, greatly adding to its strength. One of its chief characteristics is its power of resistance to the effects of fire. Not long since an interesting experiment was made. A brick building (7ft. by 4½ft. inside, and 10ft. high) was erected, and three windows of wire-glass inserted. On one side was one of a single pane, 20in. by 84in.; on the other a window of three panes, supported at their meeting edges by iron bars, and 28in. by 84in. in size; and the third was 34in. by 84in., and consisted of four panes' with the meeting edges unprotected. In the fourth side was a small door. The roof was of sheet iron, with a hole in the centre. A fire of tar barrels was lighted within the structure, and soon the glass was red-hot. Firemen then poured water upon the building, with a 20lb. pressure against the windows, but with no more effect than would happen to a sheet of red-hot iron plate. The glass cracked in all directions, but remained together as one sheet; and neither was there any indication of warping. Such is the account given of this test, which apparently fully demonstrated the claim of the firm that wired glass is "specially applicable to fireproof buildings." But it has other advantages. Used for skylights in railway stations and other places of public resort, it abolishes the need for stretching wire netting underneath to protect persons below. Again, it is of sufficient strength to prevent stones being thrown through it, and burglars would find it a very troublesome barrier to their work, seeing that it is not at all easy to cut it with a diamond. For warehouses, stables, machine shops, and other places where there are frequent breakages of window panes, Pilkington's Patent Wired Glass seems to meet a long-felt want. It is also recommended for deck, port, and cabin lights on ships.

MR. S. J. WARING, JUN., ON ART AND COMMERCE.

The first annual reunion of the combined staffs of three famous business houses identified for many generations with the rise and progress of Art in the home—Warings, Gillow, and Collinson and Lock, now formed into one Company, and trading under the name of Waring and Gillow, Limited—which took place at the Hotel Cecil, was a very interesting, and in some respects a remarkable gathering. The Great Hall of the Hotel Cecil, in which the dinner took place, was a fitting theatre for such a gathering, being one of the earliest decorative triumphs of the house of Waring. Mr. Sam J. Waring, jun., was in the chair, and in replying to the toast of "The Company," given by Mr. R. E. Lawson from the vice-chair, made some very thoughtful remarks on the fusion of Art and commerce. The endeavour of Messrs. Waring and Gillow Limited, he explained, has been to combine the artistic and commercial elements of the business, and whilst endeavouring to retain an even balance between these two great forces, familiarise to all classes the principles of purity of style, beauty of form and colour, and sound construction. We are, he said, stimulating the great artistic tide which has set in, and which is every day increasing in volume. We are endeavouring to bring within the reach and observation of all classes, not only Art in the home, but object lessons in

MR. SAM J. WARING, JUN.

the adornment of the great buildings such as that within which we now have the pleasure of meeting together. To attain this result we have organized a series of departments which shall deal comprehensively with the whole question of sanitation, decoration, and furnishing, and to place them at the service of those who constitute the architectural Profession, that has done so much to elevate the public taste and adorn our streets and houses. This will obviate the difficulties attendant on the employment of numerous contractors, and ensure the completion of an harmonious whole. The amalgamation with Warings of the famous houses of Gillow and of Collinson and Lock have been effected primarily with the object of combining in one spirit of enterprise two houses of the greatest eminence, where work of the highest class shall be produced. At the present moment extensive alterations are in various degrees of consideration and progress which will enable the famous house of Gillow, a house of nearly two centuries' standing, to exhibit the finest range of work that has ever been brought together in the history of our business in this country.—Mr. T. B. Clarke (Gillow and Co.) also responded, and, later, the Chairman gave "The Staff," to which Mr. Frank Murray, Art Director, replied.

It is proposed to erect two new churches in Blackpool—one for the north, and another in place of the old Bethesda Chapel in Kent Road.

TENDERS.

ASHTON-UNDER-LYNE.—For the construction of brick bridge, &c., over river Tame, for the Corporation. Mr. J. T. Earnshaw, C.E., Town Hall, Ashton-under-Lynde.—C. Braddock ... £2,844 1 8 Underwood & Bro. R. C. Fish ... 2,681 10 6 Dukinfield* ... £2,126 6 2 Tate & Gordon ... 2,311 7 2 *Accepted.

Surveying and Sanitary SUPPLEMENT.

JANUARY 26TH, 1898.

Practical Carpentry and Joinery.*

By GEO. ELLIS.

(Continued from page xxvi.)

CEILING JOISTS should be fixed to the binders, and not to the girders, so that they may run in the same direction as the floor joists. The joists in framed and double floors should be made to rise towards the middle of the room about $\frac{3}{4}$ in. in 20 ft. to allow for subsequent settlement. The floor joists in doorways should also be kept

Fig. 62. DANCING FLOOR.

$\frac{1}{2}$ in. higher than the remainder, to enable the door to clear carpets, &c. Girders are sometimes strengthened with an iron fitch plate bolted between the two halves of the beam. The beam is cut down the middle, the pieces reversed and turned with the centre outwards; the fitch plate should be one-twelfth the total thickness and $\frac{1}{2}$ in. less in depth than the beam, so that the weight shall not be taken by the plate when the wood shrinks. The bolts should be the same diameter as the plate is thick, but not less than $\frac{1}{2}$ in.; the larger number to be placed above the neutral axis; those below to be near the ends. In mortising a fitch girder do not cut a mortise in the same line as a bolt hole nearer to it than 18 in. According to experiments made in the Government dockyards, the breaking weight of a girder is increased two and a half times by fitching it, but a fitched girder, made up with deals or planks, will not be so strong by one-sixth as a beam of the same total dimensions cut down as above described, because planks and deals are cut from younger and weaker trees than balk timber. Iron girders are frequently used now instead of wood for large spans in combination with wood and iron binders. Both methods of treatment are shown in Fig. 60. On the left, a wood binder is shown notched on to a plate, bolted to the web of the girder. On the right a rolled iron binder is fixed by means of angle irons bolted in a similar manner. The ceiling joists are cut between the binders, and lipped over the lower flange to form a fixing

for the laths. Dancing floors are arranged so that they shall be elastic without exercising undue strain upon the walls of the building. One method is to frame the joists into a kind of curb or frame bolted together at the angles which is free to move between the walls vertically, and resting upon a series of carriage springs fixed to the wall-plates, carried on a set-off of the wall below, as shown in Fig. 61. Another way is to groove the top edges of the joists slightly, and insert rolls or cushions of solid rubber, laying the boards on this in bays formed of narrow boards glued together and nailed at their ends (see Fig. 62). Fireproof floors are formed by placing deals side by side to form a solid mass, and nailing them throughout, the under edges being dovetail grooved to form a key for the plastering.

FLOOR COVERINGS are of three kinds, boards or battens, called plain floors, parquet or veneered floors, and solid or wood block floors. Floor boards are now invariably cut from batten stuff, never from deal, unless specially ordered, for it has been proved by experience that the shrinkage and casting is much less with the narrower widths. The best prepared "yellow deal" flooring is shipped from the White Sea ports; the best spruce or "white deal" from Christiana and Dram. Floor boards are laid in two ways, folding or sprung, and pressed up with floor-dogs; in the former method a board being nailed next the wall and at right angles with the joists; then another is nailed parallel with it at a distance equal to the width of four or five boards, less $\frac{1}{2}$ in.; then the intermediate boards are placed between, tilted up in the form of an arch, two cross-pieces laid on the crown, and a workman jumps on each end of the bay, forcing them down flat, when they are immediately nailed, and the process is repeated right across the floor. This is only applicable to square or ploughed and tongued joints; other varieties are laid with the floor-dog. This is a small,

strong, iron cramp, fixed to the joists by lugs or screw-plate, and containing a stout screw mounted on an adjustable swivel eye, capable of moving forward about 6 in. They are used in pairs. One board is fixed as an abutment, then half a dozen are laid in position, the dogs brought up close and turned up, forcing the boards together with great pressure. They are then fixed with floor brads, driven in the direction of the fixed board. The brads should

Fig. 61. SPRING DANCING FLOOR.

not be longer than twice the thickness of the boards. Brads are distinguished from ordinary nails, which are termed clasp, by having their heads projecting only in one direction, whilst that of the clasp nail projects all round (see Fig. 64), in which A and C are the side, and B and D the edge views.

After the boards are all laid, and the brads punched a little below the surface, the floor is "cleaned off." This process consists in bringing the boards to a more or less regular surface with planes, &c., varying from a mere shaving at the joints to a highly-finished

Fig. 60. DETAILS OF COMPOSITE FLOOR (TWO VARIETIES).

FIG. 63. ENLARGED SECTION AT B-C, FIG. 50.

public buildings, and basements of dwelling-houses, and also for covering fireproof floors. They are durable, hygienic, and of good appearance, and are constructed of rectangular blocks of hard or soft woods, about 3in. wide by some multiple of width in length—usually four times—with thickness varying from 1in. to 3in., with square dowelled or matched edges, fixed or bedded in pitch, tar, or some elastic composition. For basements, the ground should be excavated to a depth of 8in., well rammed, and filled in with concrete, which is struck off level and allowed to dry, when it is floated in Portland cement to a depth of 1in. When this is thoroughly set, it is brushed over with a hot mixture of tar, pitch, &c.; the blocks, heat dried, are dipped in the mixture, and laid herring-bone fashion. When the space is covered, tallow is smeared over the surface to facilitate the planing. Fig. 67 is a section of a solid wood block floor for a basement.

Parquet floors are of two kinds, solid and veneered; in the solid form, the sub-floor is traversed true, and covered with pieces of hard wood of various shapes and sizes, glued down in such a manner as to form geometrical patterns, aided by the different colours of the wood: it is cleaned off in the usual way when finished. The veneer or thin parquet is made in some instances as slight as $\frac{1}{16}$ in., the better qualities about $\frac{3}{16}$ in. thick. It is glued up into square panels of from 1ft. to 3ft. wide, the component pieces ploughed and tongued at the joints, and a plough groove worked around the outside of each panel. The tongues are inserted as the panels are laid, and the last panel inserted in the centre is fastened down with screws and the holes pelleted. This latter form is removable, and does not require any particular preparation of the sub-floor.

All openings in floors should have a margin of hard wood mitred and screwed round them, to protect the edges and hide the end grain of the boards.

Fireplaces should be bordered with oak slips $2\frac{1}{2}$ in. by $\frac{1}{2}$ in., scribed to fit the hearthstones, and glued and bradded in a rebate sunk in the floor boards.

The heartsides of floor boards should always be placed downwards, as the boards curl away from the heart (see Fig. 12, page 123), and the edges being secured, the board remains flat;

FIG. 64. NAILS, FLOOR BRADS, CUT CLASP.

also the heart will frequently wear loose, and injure the feet when passing over it. For important floors the boards should be selected from those cut with the annual rings parallel to the edges; boards so cut will neither curl, tear, or shrink much.

(To be continued.)

THE Waterworks Committee of the Manchester Corporation are about to ask for the approval of the City Council to the letting of the tenders for the buildings and plant required for an additional hydraulic-power station in Manchester. Borrowing powers have been secured to the extent of £100,000, but it is not intended to expend the whole of that sum at present. The new station will be situated in Pott Street, Ancoats, on land purchased for the Paving Committee, and will ultimately, in regard to the plant, be equal in capacity to the Gloucester Street Station. It will not only be available for supplying an entirely new district, but will also be coupled to the mains in the existing area of supply, in order to remove any possibility of there being a deficiency of power.

FIG. 65. JOINTS IN FLOORING.

surface, true in every direction, and fit for polishing, according to the quality of work in hand. A description of the latter will include all the stages at which less important floors have operations suspended. The joiner commences by fastening a thin strip of wood around the edge of the floor to keep the planes from the wall, then with a rebate plane works a margin all round to the depth of the lowest board on the particular side operated on. Then the bulk of the irregularities are removed by the jack plane, the workman proceeding in a diagonal direction across the floor. This process, called traversing, is to prevent the cross-grain boards "tearing up." Then follows the trying plane, first traversing, then with the grain bringing the surface true, this being tested with straight edges as the work proceeds. Next the surface is faced up with the smoothing plane, the corners reduced to the general level by aid of thumb planes, and finally all the marks removed with a scraper (a tool to be described later on). If the floor is to be wax-polished it is now ready, but if French polished, as in parquetry, it is rubbed over in the direction of the grain with two grades of glass paper, all the holes, interstices, &c., being filled with coloured stopping.

Several forms of joints for the edges of boards are in use, designed either to prevent the passage of dirt and draught through the interstices, or to prevent the edges curling up, and in some cases to hide the method of fixing. Some of these are shown in section in Fig. 65. The Square Joint (A) is only used in inferior work, as the shrinkage of the boards soon destroys its efficiency. The Dowel Joint (B) is but a slight improvement, the shrinkage having nearly the same effect as in the latter, the boards only keeping regular at the dowels. The Ploughed and Tongued Joint (C) is the most economical and generally efficient, its principal drawbacks being the difficulty of removing a single board without disturbing the remainder, and the destruction of the joint through the wear of the upper surface. These defects are to some extent remedied in the next three methods shown. In the Hoop Iron Joint (D) a thin groove is made with the saw on each edge near the bottom surface, and thin strips of hoop iron inserted. The Filleted Joint (E), much used in warehouse and barrack floors, in which the two back edges of the boards are rebated out $\frac{1}{2}$ in. and 1in. by $\frac{1}{2}$ in. fillets laid upon the joists and the boards nailed over them. The Rebated Joint (F) is a very useful one, as only one edge of each board requires nailing. It is only suitable for boards over $1\frac{1}{2}$ in. thick. The Matched Joint (G), used in imported preparing flooring, and the improved ditto (H), for secret fixing, are good forms if the stuff is seasoned, otherwise they become irregular when the boards shrink. Of the Secret Joints (I and J), the latter is the better, to counteract shrinkage; but the tongues are very liable to get broken off by careless handling. The joints at the ends of the boards are called heading joints, and should be rebated as at K (Fig. 66), and not more than two occur without a break (see Fig. 48, page xxvi.). Bevel ends (as at L) make good joints when well fitted, but this is seldom done, the workman contenting himself with making the joint fit on the surface. Wood block floors are much used now in schools,

FIG. 66. HEADING JOINTS.

DILAPIDATIONS.*

BY PROF. HENRY BUSHELL, F.S.I.

(Continued from page xxxiv.)

GOOD tenantable repair," which one would naturally conclude means a somewhat better state of repair than in the case of Crawford v. Newton, already quoted, is apparently synonymous with "tenantable repair," and is exemplified by the well-known case of Proudfoot v. Hart, which was heard in 1890, and was a motion by the defendant that the findings and award (and the judgment directed to be entered therein) of the official referee appointed to try the question in the action be set aside or varied upon the grounds—(1) That the words "good tenantable repair" in the agreement of tenancy were wrongly construed by the official referee; (2) that his findings were against the weight of evidence; (3) that the damages awarded were excessive; (4) that he wrongly awarded the plaintiff £5 for loss of rent of the premises whilst the same were under repair. This case shows that a tenant who, by his agreement or under the covenants in his lease, is merely bound to deliver up a house at the expiration of his term in good tenantable repair, is liable on both commissive and permissive waste; but he is not bound to repair, restore, or replace anything worn out by age. He need not put up new wall papers because the old ones have worn out, nor need he repaint inside woodwork where painting is decorative only. If, however, he allows woodwork

* A paper entitled "The Practical Application of the Principles and Law of Dilapidations," read before the Auctioneers' Institute.

to perish for want of the preserving effects of paint, he is liable for permissive waste. He must patch up the premises so long as in the

FIG. 67. A SOLID BLOCK FLOOR.

nature of things patching is reasonable, but he need not renew. He is not bound to clean or scour wall paper or to whitewash ceilings. It appears that the learned official referee who tried the case in the first instance was under a wrong impression all through, as to what constituted good tenantable repair. To quote an extract from Mr. Justice Cave's summing up, he said: "Here it is quite impossible to read through what the learned official referee has said without seeing that he has not adopted that view, at all events, of the law, because he says, 'I thought that if the paper and paint were thoroughly worn out he must therefore re-paint or re-paper where done before.'" Then comes the significant remark by Mr. Justice Cave, "That is exactly what the tenant is not bound to do!" The issue was that Justices Cave and Mathew agreed in referring the case

back to the official referee. The case was, however, taken to the Court of Appeal, but the appeal was dismissed, and the view of Justices Cave and Mathew upheld. In Belshe v. McIntosh, Baron Alderson, in summing up to the jury, said: "It was difficult to suggest any material difference between the term

'HABITABLE REPAIR'

and the more common expression 'tenantable repair'; they both must import such a state, as to repair, that the premises might be used and dwelt in not only with safety, but with reasonable comfort by the class of persons by whom, and for the purposes for which they are to be occupied." "Good tenantable repair," said Lord Justice Lopes, in Proudfoot v. Hart, "is such repair as, taking into account the age of the house, the character of the house, and the locality in which the house is situated, a 'reasonably-minded tenant' of the class of tenants who would be likely to want such a house might reasonably require in order to make the house fit for his occupation." This is a praiseworthy attempt at a definition which shall be concise and comprehensive, but I fear that it, like most of our attempts, opens the door to further futile efforts in the same direction; for who can say how the phrase "reasonably-minded tenant" is to be properly defined?

"GOOD SUBSTANTIAL REPAIR"

produces some degree of uncertainty as to what is intended by such an expression. Surveyors, I think, are agreed that such implies the quality of the reparations, rather than the corporeal nature of them, as, for example, repair to the main fabric.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
Jan. 29	Wolverhampton—Construction of Shelter...	Parks and Baths Committee	J. W. Bradley, Borough Engineer, Wolverhampton.
" 29	Pudsey—Erection of Sunday School	Trustees	Hodgson and Farrar, Architects, Bank Chambers, Pudsey.
" 29	Cork—Erection of Nine Houses	J. Kelleher	W. H. Hill and Son, 28, South-mall, Cork.
" 29	Morley, Yorks.—Erection of Bakery, Stables, &c.	Metcalfe and Bradshaw	T. A. Buttery and S. B. Birds, Architects, Morley.
" 29	Pontefract—Erection of Shop Front, &c.	Mrs. Brook	Tennant and Bagley, Architects, Pontefract.
" 31	East Ham, E.—Erection of School Buildings	School Board	R. Curtis, 120, London Wall, Moorgate-street, London.
" 31	London, S.W.—Erection of Two Refreshment Houses	London County Council	Architect's Department, County Hall, Spring-gardens, S.W.
" 31	Tregaron, Wales—Erection of School	County School Managers	L. B. Price, Doldremont, Lampeter.
" 31	Cork—Pair of Semi-detached Villas		W. H. Hill and Son, 28, South-mall, Cork.
" 31	Kirkcaldy—Six Shops and Fifteen Dwelling-houses	Whytehouse Estates Co. Ltd.	R. Little, 4, St. Brycedale-avenue, Kirkcaldy.
" 31	London, E.C.—Electricity Supply Sub-station	Shoreditch Vestry	Kincaid, Waller, & Manville, 29, Gt. George-st., Westminster.
" 31	London, E.—Erection of Three Houses		W. Barker, 3, Richmond-street, Londonderry.
Feb. 1	Southampton—Erection of Hospital	Town Council	Greenway and Smith, 21, Queen Anne's-gate, Westminster.
" 1	Dudley—Erection of School, &c.	Grammar School Governors	Woodhouse and Willoughby, 100, King-street, Manchester.
" 1	Tullyallen, near Mellifont, Ireland—Church	Rev. T. Taaffe, P.P.	W. H. Byrne, 20, Suffolk-street, Dublin.
" 1	Isle of Grain, Kent—13 Coastguard Dwelling-houses	Admiralty	Director of Works Department, Northumberland-avenue, W.C.
" 1	Bourne, Lincs.—Erection of Cattle Market	Warwicks and Richardsons, Ltd.	F. G. Shilcock, Architect, West-street, Bourne.
" 1	Manchester—Erection of Sixty Cottages (Two Contracts)	Improvement Committee	City Surveyor, Town Hall, Manchester.
" 1	Paignton—Erection of Buildings	Gas Company	C. G. Dawson, Manager, Gasworks, Paignton.
" 1	Waterloo, Lanes.—Disinfector Buildings, &c.	Urban District Council	F. S. Yates, Surveyor, Fown Hall, Waterloo, Lanes.
" 1	Glasgow—Steward's House, Water Tower, &c., at Hospital (Five Contracts).	Corporation	City Engineer, 64, Cochrane-street, Glasgow.
" 1	King's Lynn—Erection of Purifying House	Gas Company	E. G. Smithard, Engineer, Gasworks, King's Lynn.
" 2	New Cross, S.E.—Structural Alterations at Hospital	Metropolitan Asylums Board	T. D. Mann, Norfolk House, Norfolk-street, Strand, W.C.
" 3	Sandbach—Brick Tank at Pumping Station	Urban District Council	W. Wyatt, Engineer, Bryndwr, All Saints, Shrewsbury.
" 3	Mitchelstown, Ireland—Residence	Guardians	R. Fitzgibbon, Clerk to Guardians, Workhouse, Mitchelstown.
" 4	Penrhyneddraeth, Wales—Vagrant Wards, Boiler-house.	Guardians of Festiniog Union	W. W. Thomas, 15, Lord-street, Liverpool.
" 4	Halifax—Pair Semi-detached Villas		M. Hall, 29, Northgate, Halifax.
" 5	Port Talbot, Wales—Erection of Schools	Margam School Board	F. B. Smith, Architect, Port Talbot.
" 5	Broadstairs—Erection of Public Conveniences	Urban District Council	H. Hurd, Town Surveyor, Council Offices, Broadstairs.
" 5	Earlestown—Erection of Premises	Industrial Co-operative Society Ltd.	P. M. Beesley, 2, Bridge-street, Earlestown.
" 7	Hipperholme, Yorks.—Erection of Offices, &c.	Urban District Council	J. F. Walsh, Architect, Lanes. & Yorks, Bank-chas. Halifax.
" 7	Weedon—Erection of Shelter, Fencing, &c.	Parish Council	J. B. Williams, Surveyor, Moot Hall, Daventry.
" 7	South Acton, W.—House and Laundries	H. Hawkes	E. Monson, 22, Buckingham-street, Adelphi, W.C.
" 8	Hove, Sussex—Erection of Three Dwelling-houses	Lords Commissioners of the Admiralty	Director of Works, 21, Northumberland-avenue, W.C.
" 8	Battersea and Hampstead—Enlargement of Fire Engine Stations.	London County Council	Architect's Department, 13, Spring-gardens, S.W.
" 9	Sunderland—Erection of Infirmary Buildings	Union Guardians	W. and T. R. Milburn, 20, Fawcett-street, Sunderland.
" 10	London, N.—Erection of Infirmary	Guardians of St. Mary, Islington	W. Smith, 65, Chancery-lane, W.C.
" 15	Ipswich—Erection of School Premises	School Board	J. S. Corder, Wimborne House, Tower-street, Ipswich.
" 15	Edmonton—Erection of Schools	School Board	H. W. Dobb, 110, London Wall, E.C.
" 22	St. Ives, Cornwall—Chapel and Schoolroom	Committee	W. Faulk, Fore-street, St. Ives, Cornwall.
Mar. 14	Llangathen, Wales—Stone Bridge over River Towy	Carmarthen County Council	T. Jones, Clerk, County Council Offices, Llandovery.
No date.	Annandale, Scotland—Erection of Hotel		F. J. C. Carruthers, 25, Buccleuch-street, Dumfries.
"	Brixham, Devon—Roof and Lead Gutters to Church		Miss E. Chilcote, Hill House, Brixham.
"	Cheadle Hulme—Alterations, &c., to Church		F. Bindloss, 4, Chapel-walks, Manchester.
"	Finedon, Northants—Erection of Six Houses		Mosley and Anderson, Goodyear-chambers, Northampton.
"	Leeds—Joiner, Plumber's, &c., Work to House		W. Squires, Architect, Royal Exchange-chambers, Leeds.
"	Leeds—Erection of Sunday School		W. F. Braithwaite, 6, South-parade, Leeds.
"	Leeds—Erection of Sixteen Houses		P. Robinson, 34, Burley-hill, Leeds.
"	Lightenham, Burnley—Farmhouse and Homestead		Kay-Shuttleworth, Estate Office, Gathorpe Hall, Burnley.
"	Leeds—Erection of Arcade		Amble and Bowman, 9, Park-place, Leeds.
"	Llanelli—Building Stables, &c.		W. Griffiths, Architect, Falcon-chambers, Llanelli.
"	Manchester—Pulling Down & Re-erection of 2 Shops, &c.		T. Cook, 39, Victoria-buildings, Victoria-street, Manchester.
"	Stafford—Building Six Cottages	Industrial Co-operative Society	N. Joyce, Architect, Greengate-street, Stafford.
"	Stanley, Durham—Erection of Two Houses	A. Cumberledge	T. E. Crossing, Architect, Stanley, R.S.O.
"	Wakefield—Formation of Cycling Track	Trinity Athletic Company, Limited	H. Crutchley, Engineer, Town Hall-chambers, Wakefield.
"	Misterton, Notts.—Erection of Two Houses	Gilbert and Hill	Eyre and Southall, Architects, Gainsborough.
"	Dublin—Alterations, &c., to Business Premises		Moyers and Sons, Architects, Foster-place, Dublin.
"	Starbeck, Harrogate—Laundry		Oliver Leeson, Architects, Mosley-st., Newcastle-on-Tyne.
"	Kendal—Six Houses	Mr. Millward and others	J. Hutton, Architect, Kendal.
"	St. Michael's, Shap—Church Restoration		G. D. Oliver, Architect, Carlisle.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

WITH SURVEYING AND SANITARY SUPPLEMENTS.

An Architectural Causerie.

The Dissipations of an Architect. At some future date we may perhaps consider from a philosophic standpoint the dissipations of the British Workman, which are more numerous and varied than one is likely, at first sight, to imagine. For the present, however, we will be content with the smaller scope presented by the consideration of the forms of dissipation to which an architect is

to design a cart-shed, or the unhappy man whose drawing desk was burdened with a pile of sketch-books, and whose terrible degradation prevented his working for more than five minutes without opening one or another, we need no further urging to adjure all most solemnly never to sketch except under the following conditions—viz., when one wishes to train one's powers of observation and test whether such powers are capable of grasping all the essentials of a building; when one feels in entire sympathy with the spirit of the building drawn; when the building illustrates some mental process that one thinks one has been able to penetrate; and in a few other cases too exceptional to require formulating. In most cases, however, the destruction of the sketch should be insisted on as the best test as to its influence being for good or evil. Another course of dissipation is open to the architect who indulges in colour fantasies. Architecture, no less than Scripture, is purely an appeal to the emotions through form, and the introduction of colour is no less distracting in one than in the other in their most intense forms

one, provided you are strong enough to reach your full height in Architecture and in your pet craft or crafts as well. But the chances are rather against you. After all, our brief exhortation but resolves itself into an expansion of the old saw about the shoemaker and his last. With this difference only, that the architect is so imbued with the many-sided character of his Profession, that he is somewhat apt to try and extend it beyond its natural and desirable limits, with the probability that by so doing he is dissipating energy not to be spared from the study of the main principles of the Art itself.

H. V. L.

The New Assistant.

It was about two o'clock, and nearly all the draughtsmen had returned from lunch. The architect, a rather good-looking man, was discussing with the head assistant the question of door heights in Mr. Slee's new house at Barnes. The architect was of opinion 7ft. openings were the least that

NOTTINGHAM CEMETERY BUILDINGS COMPETITION. FIRST PREMIATED DESIGN. BY MESSRS. MCKEWAN AND DUNN.

peculiarly liable. In order to disarm the criticisms of those who may fancy that we propose to lay bare what we may conceive to be all the architect's little private weaknesses, let us at once explain that nothing is further from our thoughts than an excursion outside the limits of the strictly professional aspect, and that the dissipations to which we shall refer are those only in which the architect and not the man is concerned. Now the first and perhaps most dangerous form of dissipation is that of sketching. We cannot go so far as some do, who say that the habit of sketching necessarily denotes a vicious and unimaginative temperament; but we are bound to admit that it is a habit which, when indulged in to excess, becomes most pernicious as a check on individual thought and freedom of ideas. When the recollection arises of that ill-starred youth, who said he had sketched everything in South Kensington, but who failed lamentably when called upon

of expression. Here, again, we cannot claim to be extremists, but only the apostles of moderation. One cannot feel any objection to the architect having some knowledge of harmony in colouring, so long as he does not sacrifice to it the keenness of his perception as regards form; if he comes to feel that colour takes first place in his mental range, let him be a decorator by all means, but he is lost to Architecture. Yet, again, let us utter a warning against another pitfall by the wayside: stifle any lurking ambition you may have to become craftsmen. It is so pretty—such a delightful road to destruction—to think if you spend all your spare time in chipping stone, or hammering silver, what charming caps you can provide for your columns, what exquisite lock-plates you can put on your doors. The house may be finished complete by the hand of a real artist without the intervention of the unsympathetic manufacturer. Who could grumble at such an ideal? No

could be managed, but the head man suggested that 6ft. 8in. was ample, or 6ft. 10in. at the very most should do for a small house. Just as the discussion seemed likely to be interesting the door opened, and Rice, a saturnine youth and a junior, marched in, went to his drawing board, and began to work immediately. The governor looked at the office clock, which indicated 2.20, and then significantly at Rice. Rice, however, was at work, and as he took but little notice of anyone, whether governor or assistant, he was unconscious of the indignant glances cast in his direction. Peter Blow, F.R.I.B.A., was annoyed; it irritated him that one of the wheels of the machinery which helped to keep his office running should be so irregular. Having given some directions to one of the other assistants, he entered the private office, slamming the door behind him. "The boss is wild to-day," said Rice to no one in particular—a remark that met with no

response except a haughty sniff from the office lad. Peter Blow sat in his chair with a perturbed air; everything seemed to be going wrong. It wasn't so much Rice coming late that upset him, but as yet he had received but three applications for the vacancy in his office. "If someone doesn't come shortly my growing reputation will evaporate like smoke," soliloquised Peter. "There are all those furniture designs, fittings, and embroideries to polish off, and there is no one in the office capable of doing it." A knock at the door interrupted his consultation with the gods. "Come in," cried Peter; "Well, what is it?" "Oh, a gentleman to see you, sir," Peter glanced at the card with its small inscription, "Arthur Merton." "Merton, Merton! I seem to know that name. Ask him in, James." The boy vanished, his place occupied a moment later by a young man about twenty-two or twenty-three, with a square sort of head, hair that rose vertically from the crown, and a roll of drawings under his arm. "You want an assistant, I believe," he hastily remarked. "Yes, yes; that is so; take a seat, Mr. Merton." Merton seated himself next the window, and, being somewhat excited, took to watching a venturesome spider trying to weave his web between the ceiling and Peter. "Well, sir," broke in Peter, annoyed at Merton's abstraction, "will you let me see some of your drawings, please?" Peter looked through the drawings carefully, and, laying them on the table, said, "You have a rare feeling for line, and the wash drawings are excellent. How about salary?" mentioning the matter as if it was of little importance. "Four guineas a week," answered Merton diffidently, "as it is a temporary job." "Quite so," said Peter, with an involuntary drop of his lower jaw. "I hadn't thought of paying so much, but your drawings are above the average, and there are several jobs you could get to work upon to-morrow. Can you come in the morning?" "Oh! yes," said the young man with but little enthusiasm. "Ah! that will suit me very well. 9.30 a.m. to 6 p.m. are the office hours, and I like my assistants to keep good time. Good afternoon, Mr. Merton."

"MODERN ARCHITECTURE."*

A BOOK FOR ARCHITECTS AND THE PUBLIC.

By H. H. STATHAM.

THIS is an earnest attempt to fill a void in professional literature. As stated in the preface, the idea of it originated in a short course of lectures delivered by the author to the Class of Design of the Architectural Association, at the request of the "Council". The first four chapters give the substance of these; the fifth, a very important one, was also delivered before the same body; and in the sixth the author gives his views on the influence of iron. It is in general cleverly, and in some parts ably, written, full of suggestive remarks that will be found interesting to the non-professional reader as well as to the architect; and it can be fairly recommended to the attention of all who seek to know his views on the subjects he touches upon. The public to whom it is addressed might, perhaps, say: "Oh, we do not care about

architectural books"; but we trust that it will not allow such prejudice to prevent this small mine of thought from being explored. for he is a real enemy to all progress, and would stifle all free expression that would not listen to every qualified man who has something to write on the theory of Art and Practice that might remove a difficulty. We are therefore glad to receive and welcome this book, though not always agreeing with the opinions it contains. The author dogmatizes on some points about which architects and critics are not agreed. He is scarcely just to the fine basilika at Tours; and his praise of the uninteresting front of La Trinité, at Paris, may be considered to be injudicious. In the notice of the church of St. Augustin, at Paris, no mention is made of the admirable attempt (a distinct step at the time of the erection) to use ironwork in an architectural manner as an integral and confessed portion of the building; and, as iron and steel will be increasingly used in most buildings (including churches) whenever the problem is—to obtain intermediate supports which shall be sufficient in strength without being prohibitive in bulk—this is an omission. In reference to what is well termed the "passage aisle plan of a church", and the remark that there are no Mediaeval precedents for treating it: the church of the Cordeliers at Toulouse, which contains most of the elements of this very simple and noble treatment, appears to have been overlooked. Plans are given in juxtaposition of three designs made for the Liverpool Cathedral; and, for the purpose of comparison, the student as well as the Public would have been helped to understand and weigh the criticism, if they had been to the same scale. Some of the opinions are given without any reason—in the manner of the ancient oracles—but, as this book may be reprinted, it is to be hoped that the canons will be clearly enunciated, so that those who come to learn may not go away unsatisfied. The remarks about the planning of doors, etc., in living rooms, are practical, and should be amplified, or a reference to Professor Kerr's work might be given in the next edition. The taste shown in the remarks on the Catholic Cathedral and on the late Rev. H. W. Beecher is questionable. Why should the cathedral not "get completed," as he inelegantly terms it? Perhaps not in our lifetime; a worthy cathedral may be, and often has been, carried on through several lifetimes, as we learn from the past; Cardinal Manning probably had this in his mind when he made the celebrated remark; and the great clergyman of New York should surely have been spared the cheap sneer on page 54. In original church plans that of the Rev. Newman Hall, and one by the late Edward J. Tarver in a N.W. suburb, have been overlooked. The illustrations are as a whole very disappointing. The small scale of the figures reduced from the page size of the Authors' Journal has resulted in a "rotteness" in the hatching which is not conducive to clearness. These are, after all, only minor blemishes in what we trust will be a much-read book; and, when the somewhat slipshod and colloquial language is improved, and some mistakes, such as that on line 26 of page 83, and that about the *terza rima* of the great Tuscan, are corrected in the next edition (soon to appear, it may be hoped), the book will take its place on the shelf of the architectural library. The work is intentionally an essay on modern Architecture. The student will find it up to date. The author has been outspoken in the honest expression of his opinions. We congratulate him on his courage, and trust that it may be rewarded in the manner he would prefer.

H. H. S.

"ST. STATHAM OF THE KEYS."

HIS "QUIET NAP."

INSTITUTES OF COMPARISON DRAWN FROM THE COMPARISONS OF THE INSTITUTE JOURNAL.

[*"Modern Architecture"* is reviewed in the current number of the *Journal of the Royal Institute of British Architects* by F. Caws.]

"One John Ruskin per century is seemingly sufficient."

With this elegant phrase, with its delicate suggestion of commercial colloquialism, Mr. Caws hints that Mr. Statham is a newer, stronger Ruskin, whose style is a

"Happy sort of compromise between the inspired eloquence and glorious nonsense of the greatest of all Art-writers, and slogging, pithy, dead-earnest unaffectedness."

We would gladly learn how "unaffectedness" can at once be "slogging, pithy, and dead-earnest."

In the same review we are told that Mr. Statham's Art is

"Masculine,"

"Eerie,"

"Full of common sense,"

"German mediævalism,"

"Piquancy,"

"Romantic individuality,"

"Sternness," and, moreover, that it is "queer."

Further, we are told that Mr. Statham is *"The Recording Angel of Architecture."*

That "His book is the (Architectural) Book of Life."

That it is an Architectural "Valhalla."

That Mr. Statham is a "self-constituted modern St. Peter."

That "his pen is a divining-rod, separating the architectural sheep and goats" (surely a new use for that much-discredited instrument)!

We are informed on the same authority that *Modern Architecture* is

"Abraham's bosom," in which "are entertained architects of Lazarus type."

This, again, is new. We have heard of many types of architects, but never of the "Lazarus type." Will Mr. Caws explain?

Again, "there is in the book, and those who figure therein, an awkward family likeness to the Institute and its present mode of admitting Fellows."

"While St. Statham of the Keys has been enjoying a quiet nap."

It is unnecessary to add further illustration.

The point we wish to make is that, whatever the judgment as to the result of Mr. Statham's patient industry, a review of this kind cannot be of service to him.

Moreover, the traditions of the Institute surely demand that discrimination, balance, and discretion should characterise utterances, issued under its authority, in its JOURNAL!

This end is not gained by well-meant but undignified references to "St. Statham of the Keys" having a "quiet nap." Even Homer nodded!

THE London and North-Western Railway Company has decided to proceed with the construction of a new station at Lancaster, the cost of which will be £60,000 to £70,000.

* "Modern Architecture: a Book for Architects and the Public," by H. Heathcote Statham, F.R.I.B.A. Price, 10s. 6d. Published by Chapman and Hall Ltd., Henrietta Street, Covent Garden.

NOTTINGHAM COMPETITION.

CEMETERY BUILDINGS AND LANDSCAPE GARDENING.

BY A SPECIAL COMMISSIONER.

THE importance of the subject involved in this competition cannot be over-estimated—a subject which touches all. The more surprising, therefore, it is to find that a mere handful of the Profession ventured to tackle it. Most of those competitively inclined were, doubtless, lured by Cardiff, others were privately engaged. But what are competitions for Municipal Buildings, Town Halls, and so forth, but the stalest affairs when compared to an essentially modern problem, a crematorium and its attendant buildings? There was also the frame to the picture in the landscape gardening, and laying

that it is inferior. It has, nevertheless, several qualifications which tend to make it suitable for a cemetery, e.g., a hard, dry, sandy soil, good, and fairly open aspects, and considerable undulation. On the other hand, it is a long and narrow strip of land containing about thirty acres, and has the embankment of the Great Northern Railway on one long side, and the Arnold Road on the other; the two short sides being merely divisional walls in, what is now, a deadly dull cabbage and turnip paradise. The site is by no means quiet, as about 260 trains pass daily on the railway, and these mostly luggage! With regard to the approach road, we need say little. Arnold Road, however, in which the principal entrance is situate, is very irregular, one part being as much as 14ft. below the site, another 13ft. above, entailing an expensive boundary wall.

The conditions, which included two admirable lithographed plans, were creditably drawn up, taking into consideration the fact that the assessors had no voice in the matter. And, as

principles, capable of constituting two bodies simultaneously was required.

The lithographed plan suggested certain positions for the buildings, and it was generally found, after studying the levels minutely, that these various sites were wisely indicated. A main carriage entrance with footways was required from Arnold Road, and another pedestrians' entrance at the Basford, or western, end of the site.

The usual requirements were included in the conditions, and any kind of perspectives were admissible. The premiums in both competitions were £100 and £50 respectively, and the intention is to carry out those placed first at 5 per cent on the cost of the works, provided that the competitor can assure the Corporation that his plans can be satisfactorily carried out within his estimate. Finally, the premiated plans become the property of the Corporation, who stated that they intended to seek the advice of an assessor for each competitor.

NOTTINGHAM CEMETERY BUILDINGS COMPETITION. FIRST PREMIATED PLAN: BY MESSRS. MCKEWAN AND DUNN.

out of the cemetery, completing the *tout ensemble*, giving additional interest and variety, and, in the hands of skilled designers, lending a possible touch of romantic pathos.

No large towns now-a-days can afford to dispense with such a possession as a fine crematorium, for therein lie the probabilities of immediate sanitary reform and consequent reduction of the death-rate. It is no part of our rights, let us recollect, to pollute the earth more than is absolutely necessary. Rather it is our moral duty to regard our possession as a loan entailing certain obligations. Therefore, in spite of several centuries of bad precedents, we are driven to recur to the most ancient method of treating the dead from practical and obviously sanitary reasons. Wherefore, it is clear that this competition is one of moment, and we believe it to be the first ever held for a crematorium.

Basford is a suburb of Nottingham to the north, and not yet much built over. The site, which is on the extreme edge of the city boundary, cannot, however, be described as fine. In fact, it were best frankly to confess

these enjoiners play a primary and highly important part in all competitions, it may be well to give a brief *résumé* thereof.

Clause 3 says:—"It is intended that the competition shall be divided into separate portions: (a) To be competed for by landscape gardeners, for the laying out and planting of the site; (b) to be competed for by architects, for the chapels, crematorium, lodges, entrance gates, boundary walls, and fencing. There will not be any objection to an architect and landscape gardener sending in joint designs, but the Corporation will be perfectly free to divide the carrying out of the work as set forth above." It was also ascertained that architects might compete for both competitions. Although the whole of the site was to be included in the design, the Corporation do not intend carrying out more than half at once. Half the area, roughly, is for the Church of England and half for dissenters. Two chapels were, of course, required, a registrar's lodge and office, a gardener's lodge with tool houses, and a sexton's lodge. Lastly, a crematorium on the very best and newest

We believe the number of the designs submitted was just over twenty, and Mr. Aston Webb, F.R.I.B.A., was duly appointed the architectural assessor, and Mr. E. H. Milner for the landscape gardening.

(To be continued.)

THE improvements in Davies Street have begun, and already certain houses are being demolished to make space for the new entrance at the Oxford Street end. This is an improvement which has long been wanted. Claridge's Hotel approaches completion, and the scaffolding is now all down and decorating has begun. In a few days' time the last of the hoardings in Mount Street, east of South Audley Street, will be down, and then this portion of the street will be finished. Mr. Lehmann's old house in Berkeley Square, which was bought by the late Lord Warwick for £15,000 and afterwards changed hands twice without being occupied, is now being prepared for occupation.

NOTTINGHAM CEMETERY BUILDINGS COMPETITION. FIRST PREMIATED DRAWINGS. BY MESSRS. McKEWAN AND DUNN.

THE INSTITUTE PRIZES AND STUDENTSHIPS.*

A CRITICISM ON THE DRAWINGS.

By ERNEST GEORGE.

I HAVE been invited to make a few remarks to the authors of the many drawings before us, on the subject of their work. Criticism means generally fault-finding, and is at all times a thankless task. You must kindly take my comments in good part, even where you find me wrong in my judgment. With numerous well-executed drawings before us, we are bound to recognise the proficiency that obtains in the matter of draughtsmanship. I suppose when most of the noble monuments of the past were built there were no such accomplished draughtsmen as many of you. It is a good thing to attain facility with the fingers, and a ready method of expressing ideas, and I believe that it helps materially towards design. Yet original ideas are few, while pretty drawings are many, and a taking manner of drawing sometimes conceals the lack of anything to say. The art may become a snare. It is well to keep in mind the fact that architects' drawings are only a means, and not an end. They are not pictures, but they are documents of the architect's scheme; they should convey to his client an idea of the house he is to have; but their first object is to show the craftsman the work that is to be done. The architect who is head and shoulders above the rest of us confesses to the burning of his beautiful drawings after they have served their practical purpose. This is not a custom one would commend. In preparing these drawings, some of you will have speculated on what the assessors desired to see. Taste is a varying quantity, and depends with each of us on the condition of the mind with regard to certain forms or colours that appear to us with freshness or with pleasant associations, or that we see after they have been too often played upon or travestied. Perhaps this is especially felt with certain so-called "Queen Anne" features that were pleasing when first introduced by good hands, but which we have seen done to death. In a street we commonly find the most ornate and richly decorated building is a public house, and we feel that a gentleman's house must be severely plain. Choice marbles, again, are so freely used in restaurants and in sanitary works that, from association, we become afraid to employ a beautiful material that Nature has placed in our hands. We are familiarised with so much commonplace and meaningless

ornament that the eye rests with pleasure on any broad wall-surface, and we are conscious of a reaction in favour of utter simplicity. A cynic has said that life would be endurable but for its pleasures. We feel that the vernacular buildings around us could be tolerated if cleared of all ornaments and futile efforts to please. It requires an artist's hand to dispose and wisely restrain the sculpture or decoration, which becomes a source of delight when it finds its right position. Still, there is a fitness in all things, and if your subject for design be a concert-hall for a wealthy city, or a mansion for a nobleman, you must not apply to it the bare treatment that would be admirable for a barrack.

THE MEASURED DRAWINGS.

For the measured drawings of "Ancient Buildings in the United Kingdom" six competitors for the medal put in a good appearance. The drawings of Clare College, Cambridge, by Mr. T. Tyrwhitt, have been awarded the prize. This interesting building has been portrayed with thoroughness. We are shown its street front, where stone mullions still obtain, though label mouldings have given place to cornices of Italian origin. The river front, though in harmony with the earlier work, has its fully developed sash windows with architraves and keystones. An admirable set of measured drawings of Thaxted Church, Essex, by Mr. Cyril Wontner Smith, receives a medal of merit. In "Kot" we have another careful set of drawings, the cloisters at Norwich. The four sides of these cloisters at first suggest repetition, till we note the interesting transition of styles from the early "Decorated" to the late "Perpendicular." The mouldings of the various epochs are given with care, though the custom of crowding the paper with mouldings makes them not always legible. Other drawings show care, steady work, and ready draughtsmanship. I do not know whether my colleagues are with me, or whether I am right in making the suggestion that it is not desirable to fill up, with full detail, the whole of each elevation, repeating innumerable mouldings or cusps. I think the balance of the drawing can be kept without all parts being carried to the bitter end, to the weariness of the artist. Personally it distresses me to see mechanical repetition. Prize drawings, of course, must not be slovenly or sketchy, and it is perhaps difficult to draw the line at anything short of finish.

THE SOANE MEDALLION.

Of the five designs submitted for the Concert Hall there are points to commend in each, although no one design is considered to reach the required standard for the Soane Medallion. The design "Pan" has style, and there is much that we like in the treatment of the exterior. The arcaded upper story is well conceived, though we think the small niches between the projecting columns are unneces-

sary, and it would be wasteful to put good sculpture in that shady retirement. Above the bold cornice and balustrade we should like the building to cease. We think that a building of this type suffers by a show of roofs. These latter are formed to accommodate the secondary hall, but this smaller hall is worth a better position than it gets in this attic story. In the absence of these roofs, the auditorium might have become an imposing feature in the composition. The plan of this building is less satisfactory than the exterior. Probably the difficulty has been to provide the required seating accommodation, and the hall is injured by its three overgrown galleries. The passages would gain by greater width, both for convenience and safety. The design "34° South" has a well-studied plan. The two galleries are in just proportion to the hall, the passages are of fair width, and the smaller hall is treated with consideration. The elevations of this building are not satisfactory, the proportions and composition of the group are not happy, and the design suffers from many stripes, the eye wearying of rustications from the plinth to the cornice. "Quod erat faciendum" is a design showing thought, and the elevations have a distinct interest. It is not, perhaps, a bad fault that it is very like a church. The square concert room is not a satisfactory shape, and the aggressive projection in the middle of a side wall for a royal box, would not be tolerated by the most loyal of subjects who cared for music. "Cornice" is a bold rusticated block, after the manner of a Florentine palace. The treatment is daring and original, and is not without dignity. The long line of columns on the flank wall would look well but for the two tiers of openings between the columns, robbing the latter of their effect as a colonnade. An arcaded treatment of these balconies might have worked better. Of "Lyra" one feels that it is rather a theatre than a concert-hall, but the circular form has its advantages. The dome has an awkward shape, which is emphasised by the strongly marked ribs upon it. There is simplicity in the general treatment, and we do not blame the design for its broad wall-spaces. With the latter, however, we feel the demand for bolder detail where mouldings and projections appear. There is too much equality about the three rows of cornices and the spaces between them, and we should like more interest about the doorways, which have each a glass shelter over them as their prominent feature. It has been decided that no design is sufficiently satisfactory, both inside and out, to merit the distinction of the Soane Medallion; there is nevertheless, evidence before us of intelligent study and of good work done; and although unsuccessful for the Medal, I am sure you will not look upon your work as wasted. Your time has been well spent on a subject of great interest, and the knowledge you have acquired will one day be turned to account. London

* A criticism on the prize drawings of the Royal Institute of British Architects, read at a meeting held on Monday, Jan. 24th.

is not yet provided with its fitting concert-hall.

THE TITE PRIZE.

"An English Villa and Garden treated in the Italian Style" was, as you know, the subject given last year for the Tite Prize; but the works on that occasion were not considered of sufficient merit to justify the award. The same subject given again has called forth a better response this year from the nine competitors who have entered the lists. Of these schemes, "Andante," by Mr. John Stevens Lee, takes the prize. There is simplicity and propriety about the villa, which in some designs, has too much the character of a large country house. The plan might in some respects be improved. The central hall with columns would have gained much if it had, in its height, included the first floor gallery, which would have opened into it. At present this gallery looks out upon the lead flat and skylight—never a comely prospect. The two passages at the ends of the loggia are unnecessary, and might have been included in the loggia. There is Art in the scheming of the garden, its features having interest without becoming obstructive. The drawing is incisive and clear, giving good expression to the design. To "Heather," by Mr. Thomas A. Pole, a second prize is awarded. It is a good drawing, showing a house with well-proportioned wings sheltering the upper terrace. The balustrade of this terrace is placed on the edge of a steep bank, where grass would not thrive happily, and I think a wall would have been more suitable in this position. A design distinguished by a device (a Circle and Triangle) has points of interest and quaint fancy, and there is good character in the house. The manner of the drawing, perhaps, gives it the feeling of being somewhat crowded and wanting in repose. "Tiber" is one of the less ambitious schemes. It is pleasant and homely, with less effort after features than we find in some of these gardens. The design "White Star" departs from the horizontal and reposeful lines of the Italian treatment. The house is rather suburban in character, and is not quite in sympathy with a formal garden.

The rooms are purposely unsymmetrical, the bay windows in each room being brought to a corner, and one end of each bay being cut off by the wall. The villa does not centre with the garden, and we think it desirable that it should do so, when the formal treatment is adopted. Other designs have their good and their weak points, but I have not criticisms of all that have come before us. I think in devising these gardens a difficulty must have been present to you all; it is that of having no obstacles to surmount in your imaginary garden. In an architectural, or built garden, the incidents that please arise generally from difficulties of level and other problems that have to be fought with; these suggest forms that would hardly occur to one on a clean sheet of paper. There are, nevertheless, many happy devices and suggestions in your several proposals.

THE PUGIN STUDENTSHIP.

For this studentship there is a very creditable show, and the subjects are generally well chosen. The prize is awarded to Mr. de Gruchy, whose merit the Institute has had the opportunity of recognising before, and it is a pleasure to see such work as he sends us. A second prize is given to Mr. Bower, and I am glad to find among his studies the grand tower of St. Mary's, Newark. I do not doubt Mr. Bower has studied also the noble interior of this church. Seeing it again the other day, I was impressed by its dignity, unity, and proportion. It possesses those qualities that are attributed rather exclusively to fine classic buildings. Mr. Fulton gives us good examples of his work. We like the way he has drawn the vigorous detail of the Scotch carver in the screen from Aberdeen. Whilst studying the old examples of carving he looks also to the original types; his thistles and other foliage are well put in, as are the crucifix and figures. Mr. Fulton is the recipient of the Aldwinckle Prize, and we shall be interested to see the results of his Spanish campaign. Before leaving these various groups of sketches I would remark that they are nearly all honest and direct in their purpose of delineation, the architectural details being the points of interest. There is not the attempt we some-

times see to give a fictitious interest by dwelling on cracks in the masonry, or dots and spots suggesting rotten bricks. We have seen these incidents forced to give a meretricious prettiness to architectural drawings.

THE OWEN JONES STUDENTSHIP.

For the Owen Jones Studentship there are but two candidates, and the work does not quite reach the level that has been attained by the late winners of the prize. The studies of ceramic work, including the Arab Hall of the late Lord Leighton, are freely drawn and put in with good colour; there is, however, no range or variety of subject. The other competitor shows greater diversity, but there is a certain harshness and want of freedom about the work, and some lack of harmony and "quality" in the colour, which are drawbacks to the interest of the subjects portrayed.

THE GRISELL GOLD MEDAL.

For the Grissell Gold Medal there are many entries, for the subject of a country church of timber is attractive. The design marked "Stavekirke," by Mr. Harbottle Reed, receives this prize. A wall of timber is unsuited to take the thrust of a roof, so the architect helps it with an inner range of posts, forming an outside aisle or passage. There is not, however, much thrust from this roof, as, although the principal has an apparent arch, there is practically a tie-beam from plate to plate. I venture to think the arch is no help to the design. Several of the schemes show a tendency to form arches, sometimes cutting them out of exceptionally long balks of timber, instead of trusting to beams, posts, and struts, which are the natural forms of wood. There are features we like in the good drawing marked "Emce," but we object to the circular-headed windows with voussiors, a direct following of stone forms. A second prize is awarded to the design "By Lamplight," the work of Mr. W. Stanley Bates. It is a good piece of timber construction, and well-proportioned. The internal design of the roof, with its rather finikin pierced work, is less commendable. In the view of the exterior one feels that the timber and shingle are overladen with lines, to the detriment of the drawing.

GREAT ART WORKERS OF THE CENTURIES.

LORENZO GHIERTI.—ART BRONZE WORKER.

By W. NORMAN BROWN.

THE compound metal bronze was not only one of the first economic products utilised by man, but it was also as subservient to the purposes of art and ornament as it was useful for the common purposes of life—whether for peace or war. It would appear that during the early Oriental and Classic period it was not uncommon to line the interiors of sumptuous buildings with metal plates. The cedar wood of Solomon's temple was, we learn from the Bible, plated with gold, and from Homer and various antique remains it would appear that large plates of bronze, probably with figures in relief, were fixed to the interior walls of palaces.

So, too, there is but little doubt that bronze figures of large size were founded at a very early period. Of such was that

Where the gigantic King of Day
On his own Rhodes looks down—

as Lord Macaulay has it in his "Prophecy of Copy." This gigantic Apollo, which strode over the harbour of Rhodes, and was accounted one of the Seven Wonders of the World, was probably formed of brazen plates bolted together. There is no doubt, however, that many antique statues were cast. During the Middle Ages iron appears to have been preferred to bronze, and, generally, hand work was more in vogue than founding. But with the great Italian Renaissance the metal again came into favour, and the art of casting also. Many of the most romantic stories of the Italian artists of the *cinque cents* enshrined in "enthralled pages" of Vasari and elsewhere, relate to bronze founding. Dreaming of these, "imagination conjures up visions" of Michael Angelo in his grief and disappointment at the loss of a whole year's work by his failure in casting the statue of Julius II. at Bologna; of that equally wonderful genius, Leonardo da Vinci, devoting ten years to the construction of an equestrian statue, doomed to destruction even during his own lifetime; and, lastly, and, perhaps, chiefly, our thoughts turn to Benvenuto Cellini, who has left us so vivid a description of his own labours, his failures, and his triumphs in his difficult art.

The Italian and German artists of the Renaissance appear to have had the highest opinion of bronze as a material for gates of large dimensions, and were very skilful in producing them in France and England at that period. We find, on the contrary, no appreciation or use of bronze for such a purpose, but an adoption of very excellent wrought iron work.

Should any of my readers, who lack the time or opportunity of seeing certain bronze *chefs d'œuvre in situ* on the continent, stroll into the South Kensington Museum, they may there make the acquaintance, through very excellent casts, of the following capital examples of bronze cast plates:

In the Architectural Court is an electrotype copy of the bronze doors of Augsburg Cathedral, South Germany. The costumes and characters in those extraordinary panels of metal work so closely resemble Byzantine ivories of the ninth century that they might well be the work of artists of that school. They were reproduced in electrotype by Messrs. Elkington in 1874.

Beside these stand the bronze doors of the Cathedral at Hildersheim, North Germany. They were designed and cast in 1015 by Bishop Bernward, whose skill as a worker in bronze and in the precious stones was far in advance of his age and country. They are also the work of Messrs. Elkington, and were executed in 1874. In the same court is a copy of the "Porta di San Ranieri" in the south transept of the Cathedral at Pisa. The panel represents events in the life of Christ. It was executed in bronze by Bonanno, a Pisan sculptor, in 1180.

Here also, in the North Court, is an example

of more moment to me in connection with the subject of this article. This is a facsimile reproduction in copper gilt of the famous gates of the Baptistery of Florence, completed by Lorenzo Ghiberti in 1424. These gates are adorned with reliefs of scenes from the Old Testament. The originals are of bronze, and still bear traces of gilding. I shall revert to these grand specimens of artistic founding presently.

Lorenzo Ghiberti was born at Florence in the year 1381. After the death of his father, his mother, Fiore (or, as we should say, Flora) married a goldsmith named Bartolo, who seems to have been the only father whom the little Lorenzo Ghiberti ever knew, and great confidence and affection existed between them. Bartolo was a clever goldsmith, and from him the boy learned the first principles of design. Lorenzo, however, did not confine himself to gold working, but delighted in modelling copies of antique medals, and also in painting, which Gherardo Starnino taught him. He made such good progress in this art that when, in 1400, he had to fly from the plague in Florence, he was fortunate enough to obtain employment at Rimini to fresco some rooms in the Palace of Carlo Malatesta, Lord of Pesaro. While here competition was invited for some large bronze gates of the Baptistery at Florence. Ghiberti prepared designs, and has himself left us the list of his rivals: "Filippo Brunellesco, Simone da Colle, Francesco di Val d'Ombino, Nicolo d'Arezzo, Jacopo della Quercia da Siena, and Niccolo Lambert." He goes on to say, with commendable brevity and emphasis: "The palm of victory was conceded to me by all the judges and by those who competed with me. Universally, the glory was given to me without any exception."

As the producer of the selected design, Ghiberti was employed to cast the gates. Bartolo, his stepfather, assisted him greatly in perfecting his design by judicious criticisms. He was associated with his stepson in the commission for making the doors of the Baptistery, which was given on November 23, 1403, but Lorenzo was bound to execute the more important portions himself. For the rest, beside Bartolo, he had several assistants, whose names have been recorded. He was also bound down to work on every week-day, and to accept no other commissions while the gates were in progress. The Merchants' Guild paid the wages and all expenses. Ghiberti's payment was at the rate of 200 florins a year, with an exceedingly lavish amount.

The doors took twenty-one years to make, and were placed in position on April 19, 1424.

COMPOSITION IN REGARD TO PUBLIC BUILDINGS.

IN discussing Mr. F. T. Baggallay's paper on "Composition in Regard to Public Buildings," read at a recent meeting of the Architectural Association, and which was published in our last two issues, Mr. J. M. Brydon said composition was one of the subjects that laid at the root of all Architecture, but, somehow, it had the least attention. Mr. Baggallay had touched upon the main features which helped to make up composition, but there were one or two points he did not bring forward in a measure that might have been expected. One was

THE INFLUENCE OF MATERIAL

in composition; it always had an immense influence on the form of a building, and naturally, therefore, on the features which made up its composition. The nobler the material, the nobler the composition, and, possibly, the higher as a work of art the building was likely to be. In all marble work—in fact, in all stones—the nobility of the material must of itself—from the capability of working, the largeness of its parts, and the colour they got from it—suggest that they had in their power something to produce a great effect by simple means; far easier than with a material of less nobility, such as brick, or that latter-day abomination—terra-cotta. Probably nearly all the great temples were developed from wooden construction, but immediately they passed from the era of woodwork, the whole construction became a stone construction; hence the great power and majesty in such a building as the Parthenon. If they attempted to erect a great public building in a smaller material than stone or marble, it was more or less a failure, a fact emphasised in several buildings erected in the time of modern Architecture. He thought it was almost impossible to get a great building out of material which was not constructive. Terra-cotta was evidently a material to be used for decoration, as, for example, at the South Kensington Science School, which was one of the typical uses to which terra-cotta could be put. Another example was the great hospital at Milan, where some beautiful terra-cotta work was used in a decorative sense. Then

A GREAT POINT TO BE CONSIDERED

in composition was the site the building was to occupy. A notable instance was the Palace of Justice at Brussels, which was admirably adapted to its site. It dictated

NOTTINGHAM CEMETERY BUILDINGS COMPETITION. FIRST PREMIATED DRAWINGS.
BY MESSRS. McKEWAN AND DUNN.

to them the form the building should take. The Church of the Salute, Venice, was another example; nothing could be more beautiful than the effect of the approach to it by water. With regard to towers, he thought it added to the dignity to see the lines of some of them go right down to the ground. An instance was the Town Hall, at Glasgow, the tower of which rose in great Classic composition from the courtyard, and was seen from various distances rising over the building. But even there one wished now and again to see the tower come right down to the ground, as they would in Wren's churches. In the design of great buildings, too much attention was given to picturesqueness and to what was called detail. Unless a building had good proportions and dignity of parts, and these were arranged in relation to each other, no amount of

PICTURESQUENESS AND DETAIL

would redeem it from utter commonplace. The first principle of all was that the body must be right before its members could be right, and that was the principle which governed composition in Architecture. Another little weakness allied to this striving after picturesqueness, was the want of reticence or simplicity, and a want of restraint. To use a vulgarism, there was a tendency to put "all the goods in the shop window." They should not waste strength and energy in sticking every mortal thing they could think of in the front. He could call to mind one or two instances in which this mistake was exemplified. There was great scope for study in the principles of composition. One of the finest works in composition was the result of Inigo Jones' beginning and Wren's completion, namely, Greenwich Hospital. That was not the only example of designing with a noble material on a wonderful site. If they studied the lines of the building they would see how great an artist was Wren. They should remember the words of Inigo Jones, a master of proportion, who had a contempt for what he called

MERE PRETTINESS AND PETTIFOGGING DETAIL,

and who said that Architecture should be "solid, proportionate, masculine, and unaffected."—Mr. H. H. Statham said he was very glad to hear somebody run a little tilt against the theory that all Architecture was dead at the Renaissance, for he considered that was a complete mistake. Fergusson and others who put forward that theory got hold of half the truth, and treated it as the whole. No doubt the theory of Architecture completely changed at the Renaissance, but since that time there had been a great deal of thoroughly original Architecture. It took some of its detail from antique, but it did not take its design or composition. Commenting upon the lecturer's criticism of Fergusson, Mr Statham said there was no doubt that Fergusson allowed himself to be so far led away by the enthusiasm of the moment as to refer to various buildings in town as the greatest or finest in the world. If they went through his works, they would see that he had one conception. He grasped the fact that the idea and the plan was the basis of the whole design. Fergusson made it a point that a building was to be judged by the conception and the plan, so that he judged by a little more than detail. On the other hand, was not refinement of detail a very good means of judging of a man's refinement of conception and the attention he gave to his Art? In regard to Mr. Baggallay's remarks

IN REFERENCE TO TOWERS,

the speaker expressed a desire to see the lines go down to the ground. He suggested there were occasions when buildings, placed at the angle of two streets, and where the angle formed a very important part, as seen down two thoroughfares, that it was quite right to accentuate the tower, and make it the keystone of the whole building. But he thought the whole question depended upon the site. He agreed with the lecturer that it was important to have a fine staircase, and also as to the difficulty of getting one in England, where it was considered a waste of space. He

likewise agreed that too much attention was paid to picturesqueness, and he was afraid it arose from the tendency to do so much by competition, in which there was an inclination to catch the eyes by picturesqueness rather than by well-worked-out plans.—Mr. A. T. Bolton said, with regard to the composition of the German Parliament House, to which reference had been made, he remembered it was stated in a paper at the time the building was opened, that it was not the fault of the architect but the committee, who insisted on the central feature being lowered some 15ft. from the original design. Whatever they said about Architecture nearly always resolved itself into ideas according to their own mind. With regard to

FRENCH BUILDINGS,

he thought it was a question of education; the detail was about as fine as it could be. The whole idea of the French was very arbitrary, viz., "we have got certain models given to us, left by Greeks and Romans, and the thing is to apply them." He did not think it necessary to always have a great central feature; in fact, some buildings were exceedingly fine with purely horizontal lines, for instance, the Pitti Palace. The idea of not showing the roof of a building was, of course, Wren's, who thought no roof ought to be seen except the spherical. Mr. Brydon had been very hard in his criticism of bricks. The simple explanation was that bricks did not always have a fair chance. Some very dignified buildings had been erected in brick; for instance, the Spanish palaces at Saragossa, and certain old Roman walls which had a grand effect. The reason why bricks were not so successful was that they were used with stone detail. Every brick had a moulding on it, so to speak, and each brick got a certain emphasis, and in fine examples of

BRICK ARCHITECTURE,

bricks were thrown in like cubes of mosaic work, and they got a noble effect.—Mr. A. S. Flower observed that there was a great deal to be said on both sides as to the question of towers, but if it came to voting he would prefer to vote for the author of the paper. In most cases they got a better effect if the line was not carried right down to the ground. In Salisbury Cathedral and other buildings they had good examples. In many village churches, where the tower went down to the ground, the effect was wonderfully improved by tombstones and foliage, etc., in front of the tower. He thought a tower rising from the centre of the building was very often much better than one like the Victoria, which ran right down to the ground. In this connection the central tower of Lincoln Cathedral was greatly spoilt, it having the appearance of falling to pieces at the top. There was no cornice, and it was like a bundle of reeds falling apart. They hardly got a church design now without seeing the tower simply

A BATCH OF BUTTRESSES,

and scarcely any cornices at all. This idea of doing away with connecting or tying lines seemed to be the fashion in the newer kind of design, and it was a perverse fashion that he would like to see done away with as far as possible.—Mr. Banister, F. Fletcher recommended students to read Burke's essay on the "Sublime and Beautiful," in which were many points connected with beauty in Architecture. He thought Mr. Baggallay's paper should lead them to consider why they did not study composition, for it was a most valuable part of the architect's Profession. He suggested that a class should be formed on the subject.—The President (Mr. H. W. Pratt) said the site was at the base of all composition, more especially in town Architecture, rather than in the open country. With regard to the influence of material in composition, it was not only a question of material, but also of colour, which, of course, was mixed up in the effects. Whatever they said about brick, they always had it with them, and, therefore, must always take it into consideration. As a material so largely used, they could not always look upon it as a decorative material, but where used in connection with stone it did largely affect the compo-

sition, and might greatly mar the composition of a building unless its use was very carefully considered. As to Mr. Baggallay's remarks about

THE REPETITION OF FEATURES

where there were a number of towers, he thought that applied more to towers than to domes. Therefore he would differ from the lecturer if he applied the same rule to domes as to towers. Upon the question of picturesqueness and detail there was a feeling that in smaller buildings there was not much chance of composition, and, having nothing to give any particular feature to the building, they were tempted to go in for quaintness and picturesqueness, to the exclusion of the grander ideas of conception. With regard to the smallness of detail, there were buildings in London which, in his opinion, had been spoilt on account of the detail being so very small. He thought they could have refinement of detail, and at the same time boldness. It was the pettiness of detail which spoilt the effect of a building.—Mr. Baggallay, in acknowledging the vote of thanks accorded him, said he must confess he had overlooked the fact that material did influence the general composition, through the details, as it were. In regard to a tower, he thought he stated in his paper that it would loose in effect unless carried to the ground. If they wanted a fine tower, no doubt they would have to carry it to the ground, but if they were thinking of the whole composition, he would adhere to his previous opinion, that the tower should be placed behind, or where it would form a central feature of the whole building, and not astride on the corner, or even where it was a prominent junction of two streets. He purposely did not quote Greenwich Hospital because it was contrary to his theory for a central feature. It was a fine design, no doubt, but one of those exceptions to the rule which it would take an Inigo Jones and a Wren to bring to perfection. He would not advise anyone to put up a building, so that they got two wings and could see right through them.

FERGUSSON'S BOOK

was wonderful, and gave many ideas, but he was sorry it was recognised as one of the standard works, because he was sure it was dangerous to amateurs and young students, who really did not know how to sift the good from the bad. He wished someone would write something else to take its place. He (the lecturer) had perhaps exaggerated his contempt for detail, but at the same time he would point out that they would get refinement of detail if they used the old work instead of trying to invent new for themselves. There was a feeling in England that square flat domes were ugly features. He had spent some little time abroad, and might be more or less prejudiced, but he doubted if they were always ugly features, and thought English architects might use them sometimes. He agreed they could not have a really great building if they erected it in brick, on account of the smallness of the material. At the same time they could not regard brick as only a decorative material.

The Public Works Committee of New South Wales has decided that it is not expedient to erect new Parliament Houses for the Colony. The committee recommends an expenditure of £15,000 for carrying out a scheme by the Government architect for improving the present buildings.

The demolition of the old buildings in Church Street from Orchard Street to Messrs. Webster and Styring's new premises removes another bit of "old Sheffield." The corner house contained a room with a remarkable gold ceiling, the pride of the occupier, who lavished money upon it as men will do in prosecution of a fad.

A STAINED glass window has been placed in the Abbey Church of Minster-in-Sheppey to commemorate the Diamond Jubilee. The window depicts Queen Sexburga, widow of Ercmbert, King of Kent, who founded the Abbey in the year 664, standing in an open field arrayed in her robes as an Abbess, and holding her crozier in her right hand.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
February 2nd, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE remaining vacancies at the Academy—two R.A.'s and one A.R.A.—will be filled up to-day (Wednesday). It is expected that a sculptor will be promoted, though there are five R.A. sculptors already—Messrs. Armstead, Brock, Ford, Gilbert, and Thornycroft. There are only two sculptor A.R.A.'s, Mr. Bates and Mr. Frampton, and the latter is the favourite. For the other vacancy, the Academy having got its architect, it is thought a painter will be advanced, and the popular candidate seems to be Mr. Leader, A.R.A., an admirable choice. Mr. Seymour Lucas would be the alternative, and he made so good a fight on the last occasion that his friends are very sanguine of his success.

THIS winter has been remarkably favourable to outdoor building operations everywhere and the new block of the Admiralty buildings has made rapid progress. The foundations have been got in, and the superstructure is now approaching the level of the first floor. The foundations have proved more troublesome than in the previous block. Loose, watery gravel covered the London clay to a considerable depth, and when the difficulty of dealing with the water had been overcome and the clay reached, it was found to slope down towards the river bed in a very troublesome manner, necessitating the carrying down the concrete in steps. However, all has been successfully carried out, and the new building is rising from a kind of watertight tank. The old edifice close at hand was not planted the same way at all. It rests not on the London clay, but on the top of the swampy ooze and gravel. Why it has never sunk into it is something of a mystery. There is supposed to be a large amount of British oak underneath it, and it has probably been tied together by iron girders. At any rate the old ship floats, and will continue to form part of the re-constructed Admiralty.

At a special meeting of the Morecambe District Council the twelve competitive schemes for the sewerage of Morecambe were considered, and eventually that submitted by "Forward" was adopted. The scheme will serve for a population of 60,000, and will include Bare and Torrisholme. The estimated cost of the works is £39,227 10s. 7d., exclusive of wayleaves, engineering, or land, with an estimated annual working expense of £620 2s. 6d., estimated for a population of 45,000. To this must be added the cost of the septic system,

which it has been agreed to adopt, and which will form a part of the scheme. The successful competitor is Mr. H. B. Nichol, C.E., 60, Corporation Street, Birmingham. The cost of the various schemes submitted varied from £19,000 to £66,000.

THE proposal that a bust of Lord Esher should be erected near the Appeal Court in which he presided is accompanied by a complaint of the scarcity of statuary in the Law Courts. Sir George Jessel is the only judge to whose memory a piece of sculpture has been erected in the Royal Palace of Justice. The suggestion that the building should be adorned by statues and busts of great lawyers has much to recommend it; but it is in its possible developments that its chief attraction lies. Why should not the walls of the courts be adorned by appropriate pictures from legal history?

At the meeting of the R.I.B.A. on Monday next, 7th inst., Mr. Edwin O. Sachs will read a paper on "The Housing of the Drama," with special reference to subscription and endowed theatres. The synopsis foreshadows a very interesting and instructive lecture on buildings devoted to the drama as distinct from opera or other forms of entertainment. A large collection of drawings and photographs of the principal playhouses of Europe will be exhibited. This collection will include work by the following past or present honorary corresponding members of the R.I.B.A.:—Charles Garnier (Paris), Baron Hasenauer (Vienna), Ferdinand Felner (Vienna), Victor Schroeter (St. Petersburg), G. Basile (Palermo), Gotfried Semper (Dresden), Von Ybl (Budapesth). Several gentlemen prominently associated with the drama and the stage have been invited to participate in the discussion.

CONSIDERABLE alterations are being made in Mr. Bischoffsheim's house in South Audley Street. The bow window facing Deanery Street is being taken out and the room lengthened; while the large glass conservatory at the back has been removed and a more elaborate one is to take its place. Various other changes are being made.

THE City and Waterloo Railway, which will give the London and South-Western Railway direct access from the Waterloo terminus to the heart of the City, will shortly be opened for traffic. The line itself was completed some time ago, but delay which could not be avoided has occurred, both by reason of the dispute in the engineering trade and also in connection with the enormous amount of underground work which has had to be undertaken by the Central London Railway Company at the new station opposite the Mansion House.

THE Queen, it is stated, meditates making some improvements at Osborne. Her Majesty's architect has placed certain plans before the Queen in harmony with her suggestions. As a result the work will, in all probability, be proceeded with as soon as her Majesty has vacated the mansion for her next visit to Scotland. Another scheme of the Queen is an addition to the cottages on the royal estate, but apparently this has not been finally decided upon.

MR. JOHN EDWARDS-MOSS writes, calling attention to the possible ruin of Henley involved by the provisions of the Great Western Railway (New Works) Bill. The Company in question propose to make a new line from Marlow to Henley, and to construct a bridge over the river 21ft. 6in. above water level. It is understood that the present Henley Station is to be devoted solely to goods traffic, and that a new station is to accommodate passengers on a site near the Grand Stand.

THE West Ham School Board has erected new offices in The Grove, Stratford, from plans by Mr. W. Jacques, the architect to the Board. The building has cost, exclusive of the electric light installation, close on £14,000. The

principal apartment is the Board room, 35ft. by 40ft. It has a low octagonal dome, each of the eight sides of which is fitted with a semi-elliptical window glazed with coloured glass. One end of the room, separately approached, is allocated to the public. The members will be seated at separate desks arranged in a semi-circle in front of a dais for the chairman and principal officers. The floors throughout, and the greater part of the roof, are of steel and concrete, the paving of the corridors being of mosaic.

THE Battersea Vestry has opened some municipal buildings which are believed to be unique in the Metropolis. Since October, 1895, the vestry of this portion of London resolved to execute all its public works without the intervention of contractors. Since that date twenty-six schemes of a varied nature—including roadmaking and paving works, sewer construction, the erection of new buildings, and the alteration and repair of existing structures—have been carried out by the Works Department of the Vestry, at a total cost of nearly £22,000, and in only three cases has the cost of executing a scheme exceeded the estimate prepared by an independent surveyor. The amount of the excess in these instances made a total of £204, while, on the other hand, the sums by which the cost fell below expectation in the remaining cases amounted to £2062. So satisfied was the majority of the Vestry with the result of its experiment, that it determined to go beyond any other similar authority in London, and to effect the complete exclusion of the contractor. It is with this object that municipal workshops have been built, at a cost of £4688. To this is to be added $\frac{7}{8}$ per cent. as the proportion which it has been decided that the Works Department shall bear of the cost of the official staff of the Vestry, and an expenditure of £1506 for machinery and £665 for wood-paving raises the total cost to £7210. The new shops form a plain, substantial building 300ft. long and about 25ft. wide. For the greater part of its length the structure is of two storeys, and in it are provided shops for carpenters, joiners, wheelwrights, plumbers, smiths, engineers, painters, masons, and harness-makers, together with a mess-room, an office, and a large covered shed.

A PROPOSAL has been made for the erection of a memorial to the martyrs burnt at the stake in Canterbury during the reign of Queen Mary. The committee concerned have secured a rectangular site, with a frontage of 100ft. to the Martyrs' Field Road. The monument, a granite obelisk, on a marble plinth and rock base, will stand on the spot traditionally associated with forty of the Marian executions, and the space will be planted and inclosed.

THE reredos in Bristol Cathedral, as a memorial to Bishop Ellicott, will be executed by the son of the late Mr. Pearson, R.A. The design shows an elaborate structure in stone upwards of 17ft. wide and 27ft. high. The Crucifixion, with SS. Mary and John, occupies the centre niche of the upper portion, and other niches contain figures of saints and angels. The centre niche in the lower portion will contain a representation of the "Presentation in the Temple," and on the other side will be the "Blessed Virgin and St. Gabriel." A panelled and traceried screen, 11ft. high, with buttresses and pinnacles, separates the eastern bay of the choir from its eastern chapel, flanking the reredos on either side.

THE kiosks are now well on their way as a feature of London street life. Two or three have been put up experimentally between Tottenham Court Circus and Chancery Lane, and others are to follow as fast as the "Streets Syndicate, Limited," can manage it. It is to be hoped (says the Daily News) that the vestries will walk warily before they give extended powers. After all, the space with which they deal is space that belongs to the entire public, and there is none too much of it as it stands in our narrow thoroughfares. As it is we are losing some of it every day, what with fire stations, cabmen's shelters, fire

alarms, orderly boxes, post boxes, and sand boxes, and all the rest of it. We hardly realise how much of the use of the streets for ordinary purposes of locomotion we have lost of late years. If we do not watch it we shall soon have to pick our way between two lines of booths. The public authority seems still to be in search of a principle for such concessions. The clear principle is that of indispensable public uses; and the time is coming when it ought to be rigorously applied. Can we rightly be called on to suffer further privations for the sake of having a cigarette or a nosegay ready to hand at every street corner? It is questionable.

THE Mercers' Company and the Gresham Committee are having a niche prepared on the south wall of the ambulatory of the Royal Exchange for another mural decoration. This will make the fifth of the eight works which different donors have promised already. The subject of the new panel is an interesting and historical episode, "The Opening of the Royal Exchange by Queen Elizabeth on horseback." The painting is the gift of the Mercers' Company, and the artist is Mr. Ernest Crofts, A.R.A.

A good deal of interest has been aroused in reference to the Boadicea monument which has been temporarily fixed on the Victoria Embankment. It is the work of Thomas Thornycroft, father of the present R.A., and is the gift of Mr. John I. Thornycroft. In order to ensure the choice of the best position, a plaster cast has been erected on the suggested site. A chariot, represented as made of wicker, with wheels of solid wood—the traditional scythe blades sticking in the axle—is drawn by a pair of furious horses. In the car stands the gigantic figure of the Queen, her arms uplifted in passionate appeal, the right hand grasping a spear. On either side are crouching her two daughters, nude to the waist. The flying manes of the horses and the forward-leaning figures indicate the speed of the car. It will be seen at once that, striking as the group is, the sculptor has not striven after historic accuracy. If the British Warrior Queen be indeed a real person—and so much, at least, history is prepared to concede—she was unmistakably a savage; far enough from the lady-like woman represented here. The conception is ultra-modern; but to be tolerable at all no doubt it demands idealisation.

RECENTLY a meeting of the ratepayers of the wards of Cripplegate Within and Without was held to consider the report of the Cripplegate Ward Fire Committee, who stated that, after full consideration of the many plans submitted to them, and after waiting on the Commissioners of Sewers, they had unanimously resolved to urge on the Corporation of the City of London the following proposals:—(1) The widening of Jewin Street on the north side; (2) the forming of a central Fire Brigade station; and (3) the forming of a new street in lieu of Well Street and Hamsell Street. The meeting of ratepayers adopted the report.

It was not supposed till lately that the ancient Mexicans were so far advanced in civilisation as to make terra-cotta statues. One has been discovered in a cavern by an Indian, and is now in the U.S. Museum of Ethnology. It is 5ft. high, and dates from before the Spanish conquest. The figure was moulded in three parts, head, trunk, and legs, which are skilfully put together.

THE Princess Louise and the Marquis of Lorne visited the works of Mr. J. Thompson, Peterborough, a few days since. Some specimens of carving were brought under the notice of the visitors, among them being a triptych for Sledmere Church, Yorkshire, which is being rebuilt by Sir Tatton Sykes. The triptych represents the Crucifixion and the twelve Apostles. It was designed by Mr. Temple Moore. A pulpit in oak and some elaborate tracery fronts for choir benches for the same church were also exhibited, as was a richly-carved oak pulpit intended for St. Saviour's, Southwark, and designed by Sir Arthur Blom-

field, R.A. The attention of the visitors was also directed to some carved oak choir fronts for Burnham Thorpe Church, Norfolk, as well as to a model of Peterborough Cathedral. The Princess was especially interested in four figures of saints carved in Carlisle stone, and intended to be placed in Sledmere Church.

THE Manchester Art Gallery Committee have come to a saner conclusion than that which recommended the abandonment of the autumn exhibition, which has been held annually since 1823. It will be remembered that last October the committee gave it as their reason for this suggested step that the constantly growing permanent collection, housed in the City Art Gallery, had greatly encroached upon the space available for the autumn exhibition; and although, by structural alterations, three rooms had been added to the galleries since 1882, it had become impossible to accommodate the Art Exhibition, except at the cost of crowding the permanent collection (now valued at £50,000) into little more than half the space needed for its satisfactory exhibition. No little outcry was raised in Manchester against the suggested abandonment; and after devoting three months to the reconsideration of the matter, the committee have arrived at the conclusion that the case may be met by the provision of additional accommodation! The only wonder is that such a course should not have suggested itself to them before.

IF variety be a reliable factor in success, the forthcoming exhibitions of arts and crafts at the Walker Art Gallery, Liverpool, should be a successful one, on account of the number of supplementary exhibits to be included. The Indian and Indo-Persian decorative Art, selected from the Indian Museum at South Kensington, will occupy, most probably, the whole of the "Grosvenor" room. Other rooms will contain drawings by the members of the Liverpool Architectural Society.

A CORRESPONDENT sends us the following cutting from the Melbourne Argus: "Mr. Lloyd Tayler, F.R.I.B.A., who has recently returned from a visit to Europe, gave an interesting address on the comparison between English and colonial Architecture, in which he gave the superiority, both in design and workmanship, to the colony. On account of the suburban residences in England being built mostly on leased ground, they were constructed in such a 'run-'em-up' style that they barely lasted out the expiration of the lease. The metropolitan sewerage scheme when completed would be, he considered, in advance of anything of the kind in other large cities in Europe." Comment, adds our correspondent, in this case is needless.

THE East Kent Times says: "Some of our municipal friends are making, it is averred, another effort to contribute to the public gaiety by a suggestion to send out a Roving Commission on Surveyors. Disdaining to follow the methods ordinarily adopted when an appointment of this kind needs to be filled, they are credited with the intention of sending three of their number—presumably experts—upon a sort of personally conducted tour in divers parts of the earth with the object of inquiring into the practical abilities of some of the candidates. It is understood that the scope of their investigations—the 'terms of reference,' to be more correct—are practically unlimited, and that the pedigree, age, private character, and birth-marks (if any) of the respective candidates will be made the subject of rigid inquiry."

JUDGING from the pronounced success of the first of the series of Fine Art Exhibitions held there last season, Dresden promises to become an important competitor with Berlin and Munich as an art centre. Not only were the works exhibited representative of the best from all nations, but unwonted care and attention was bestowed upon the hanging of the pictures and the grouping of the sculpture. The usual method of laboriously fitting vast numbers of different-sized frames together in

such a way as to leave scarcely a square foot of the wall visible was abandoned in favour of but two rows of pictures with sufficient space between the frames. Each gallery, moreover, was arranged as nearly as possible in the manner that a private collector of taste would arrange his house; pictures, sculpture, and works of applied art being intermingled so as not to weary the eye with the presentation of an endless surface of one kind of work. Considering that Dresden has not as yet earned a reputation as a picture "market," the promoters of the exhibition have reason to congratulate themselves upon the fact that works of art to the value of nearly £18,000 were sold. The next exhibition will be held in 1899.

THE monument to Jules Anspach, the burgo-master who was the Hausmann of Brussels, has been unveiled in that capital. It is as gorgeous as the use of marble, bronze, gilded bronze, red granite, and blue and grey stone can make it. And this prodigality of materials, always rather a dangerous experiment, has been combined with one still more risky, the intrusting of the work to several different hands. The result is a lack of unity and repose in this "busy" and somewhat garish erection.

MR. WALTER CRANE, lecturing at the College of Preceptors on "The Language of Line," said one of the earliest languages was that which took the form of signs, in which men depicted their views by hieroglyphics. The language of line was also associated with Decorative Art, in which it attained its highest form. In its graphic developments it imitated the facts and forms and service of language. The signs used in the early ages were in many cases in vogue at the present day, and from many of the characters of the ancient sign-writings we were able to obtain glimpses of the dead races. Even some of the letters of the English alphabet had been derived from the hieroglyphic system of the Egyptians. The graphic expression of lines had become a means of delineation of character, and a faithful chronicler of temporary life, manners, and history. There was a great increase of illustrations in literature, especially newspapers, and he expressed surprise that no one was enterprising enough to try to start a newspaper depicting the news of the day in the line language pictorially.

SUPPLANTING the usual winter exhibition of pictures and sketches by members, which has somewhat prematurely vanished from the walls of the Royal Water-colour Society's Gallery in Pall Mall East, comes opportunely a most attractive collection of works in water-colours by the late president, Sir John Gilbert. This does not pretend to be an exhaustive display of the versatile master's life-work, since nothing is here to show his hand as a painter in oils, and even the display of water-colour paintings, sketches, studies, and drawings is necessarily restricted by the wall-space at command. Still there is to be found in the Society's gallery ample material upon which to base an estimate of Sir John Gilbert's facile and brilliant, if hardly very profound, Art.

THE Visiting Committee of the City Lunatic Asylum have presented to the Corporation a report on a reference to inquire whether some reduction could be effected in the estimate of £70,000 for carrying out certain improvements in the Asylum at Stone, near Dartford, required to be made under the provisions of the Lunacy Acts. The original estimate for the works was £46,770, to which the Corporation agreed, but, when the tenders came in, it was found that the lowest was about £70,000. The visiting committee applied for authority to raise this sum instead of the smaller, by rate to be levied in the City, but at the instance of the late Mr. Alderman Halse the Common Council sent back its report for revision. It has, however, found that, due regard being had to the efficiency of the improvements, while it was possible, by using inferior materials in the construction of the chapel, to effect a saving of £2400, they could

not recommend any reduction in the estimate. The cost of converting the existing chapel into a recreation-room would be £1329, and the erection of a new chapel £8716. In the asylum chapel all the seating accommodation must be on the ground floor—thus materially increasing the expense—and the Commissioners of Lunacy had insisted on a larger seating space per person being provided than in an ordinary chapel, in order that the patients should not be in the least crowded. The visiting committee, therefore, reluctantly adhered to the increased estimate of £70,000. The Corporation, at the meeting at which the report was considered, adopted this recommendation, but referred the question of extending the period over which the money should be raised by county rate to the County Purposes Committee.

LECTURING ON "Humour in Art," at the Athenæum Hall, Glasgow, under the auspices of the Scottish Society of Literature and Art, Mr. J. H. Ohea said humour was in all art. The earliest specimens of art which came to us from Babylonia, Assyria, and Egypt were all tainted with it, and it must have been unconscious humour, because the specimens that had come down were almost invariably in the form of monumental Art, and were the effigies of great people, with whom it would have been dangerous for the artist to have indulged any private taste for humour. Greek Art was so perfect that there was no unconscious humour in it. The Greeks had a calculated fun which found expression in masks. When the Romans overcame the Greeks they stole the Greek artists and debauched them with luxury; but the combination of Greece and Rome produced the beautiful Græco-Roman Art, and when Rome in turn was conquered by the Goths her civilisation was overwhelmed and her art destroyed. Curiously the barbarian Goth, under the influence of the sunny South, became an artist himself, and created a new art, which found expression in raising great minsters and cathedrals, imitative of the groves in which their forefathers worshipped. This Goth, having turned Christian, became a great devotee, and there was not much humour in him, but the cathedrals, however, did show some samples of humour, which could not be altogether repressed, and it usually took the form of caricatures of the gentlemen who used to pray or snore in the cathedrals. The lecturer touched on the period of the Renaissance, in which, he said, great numbers of artists adopted humorous designs as a profession, and this had continued down to the present time.

"No other town in South Africa just now can show such an amount of progress, or surpass Bulawayo in its building operations," says the Rhodesian Review. "All temporary structures are being pulled down, and their places occupied by cut stone and brick edifices, some of a high-class order." A few examples are given, such as the Wesleyan Church, being built at a cost of £4000, with a point gable supported by four large stone columns, each column consisting of a solid block 7ft. high, having capitals of the German composite order. The church will be lighted with electricity throughout. A fine block of buildings is in course of erection for the Town Stands Syndicate, to order of Messrs. Macauley, Tompkins, and Co., and is situated between Fort and Jameson Streets. It will consist of offices and chambers, and is estimated to cost about £6000. The Umgusa Estate Hotel is being erected in one of the suburbs, and when completed is stated to eclipse all rivals in or around Bulawayo. It has a verandah of 15ft. in depth right around the building, and a grand dining-room, with other ample accommodation. Another hotel is nearly finished in town, namely, the Imperial, which has a dining-room 40ft. by 30ft., commercial-room, offices, sitting-room, bar, and two smoking-rooms. On the upper story will be the billiard-room, bedrooms, and bathrooms. This structure will cost £8000. Mr. Byrne has in course of erection an extensive and handsome drug store, the front to be composed of gun-metal and plate glass, specially manufactured by Messrs. Haskins

Bros., of London, and of a highly ornamental and elaborate design. This will cost £2000 for erection. The Rhodesian Mining and Finance Co. have in hand the erection of a block of imposing buildings on one of the best sites in Main Street, adjoining the Post Office and Stock Exchange, which will cost £10,000. The main building has a red stone front relieved with white stone dressings. There are two floors, and the offices are lofty, having a height of 12ft. These are only some of the many building enterprises now in progression, and as soon as the price of transport becomes reduced many others already projected will be proceeded with.

In a letter to the Times, appealing for funds for the restoration of Bow Church, the Bishop Suffragan and the Archdeacon of London state:—"A disaster has befallen the ancient parish of Bow. Its parish church, one of the oldest in London, from time to time patched and repaired, is now pronounced unsafe by Sir Arthur Blomfield, and has been closed during the last sixteen months. In September, 1896, the roof of the chancel fell in. The original structure, although tottering to decay, still remains a correct specimen of the Architecture of the early part of the fourteenth century, and the tower forms a noble object in the middle of Bow Road, the whole length of which it dominates. A temporary iron church has been opened, holding 800; but the duty of restoring the old parish church is obvious. A sum of not less than £5000 would be required for this purpose. It is impossible to acquiesce in the collapse and ruin of an important church of 1181 A.D. in one of the most crowded parts of the metropolitan area."

At a recent meeting of Freemasons at Glasgow, Messrs. James Chalmers, architect, and E. C. Morgan, builder, gave a Masonic explanation of the design of the crypt of Glasgow Cathedral. Mr. Chalmers, referring to the recent controversy upon the subject, said that no architect, however eminent, had been able to explain the motive of the man who designed the crypt. It was evident the explanation could not be found in architectural routine or religious symbolism. It naturally remained to consider whether or not Freemasonry among its many secrets contained a solution of this very intricate but interesting problem. No doubt the cathedral was full of Masonic symbols, and it was a question for decision whether the design could be explained by religious symbolism, as we now knew it, or required the light of Masonry. It was reasonable to regard the original architect as a Freemason. Mr. Chalmers showed early documents held by Masons, such as old constitutions and companionships and other ancient societies, which there was reasonable ground for believing existed in the thirteenth century. —Mr. Morgan dealt in detail with a comparison of the plan of the crypt with that of Solomon's Temple, and expressed the opinion that this was the key to the design. He also showed wherein some of the most valuable symbolisms could be found in the crypt.—Mr. Chalmers, in turn, stated that he had extended inquiries to the nave and lady chapel of the cathedral, and had found more advanced symbols.

A CITY Surveyor, writing on "the very insufficient mode of planning and constructing the great majority of city warehouse properties," says: "The first matter that I consider calls for attention, and which should be insisted upon in the case of all warehouses and manufacturing premises, is as regards roofs of such buildings. Surely all roofs should be of iron and concrete construction, and all roof lights of metal. The present employment of fir rafters covered with slate, and deal dormers and skylights with lead flats and gutterings, is to be condemned, inasmuch as such roofs are attacked and destroyed in a few minutes by a fire at opposite or adjoining premises. The second is some restriction as to internal areas and wells for light and air. What chance do buildings at present have when within some 12ft. of the large lights at the back of the

premises an opposite warehouse is well alight? The opposing windows should not be less than 25ft. apart, the frames and sashes should be of metal, and they should be covered by an iron shutter, which should be always closed in the evening, and if necessity arose. All ceilings should be made and plastered in asbestos or other fire-resisting cement on wire laths, and matchboarding should on no account be allowed. All constructional ironwork in floor girders, columns, and stanchions should be entirely and solidly encased in concrete of a specified thickness. Staircases, if not of stone or concrete, should be of hard wood on metal strings and carriages. All staircases and passages should be enclosed on each floor with partitions of metal and plastering, and no wood should enter into their construction excepting as to the doors, which should be of solid and hard wood. I could mention cases within my own knowledge where the absence of such construction as I have particularised has led to the rapid spread of fire and the wholesale destruction of property. All this is not information to architects. They know of it quite well, but, inasmuch as it would mean an enhanced outlay, and the law does not insist upon it, the clients for whom they build can be induced only in rare cases to adopt such methods, and consequently the old abuses are perpetrated afresh."

A PORTRAIT of Madame Vigée Le Brun, painted by herself at the age of 27, has been purchased for the National Gallery. It is placed in Room XVII. The Rev. Alfred Gurney has bequeathed to the Gallery the portrait by Mr. G. F. Watts, R.A., of the late Mr. Russell Gurney, Recorder of London. A body of subscribers have presented to the National Gallery through their hon. treasurer, Sir James Blyth, a picture by Mr. Frederick Goodall, R.A., entitled, "The Ploughman and Shepherdess," exhibited last summer in the Royal Academy. This picture is hung in the National Gallery of British Art, Millbank. The portrait of Mr. G. F. Watts, R.A., by himself, which was bequeathed under certain conditions to the nation in 1892 by the late Sir William Bowman, is now placed in the same Gallery. The condition attached to the bequest, that this portrait should be hung with any collection of Mr. Watts's works that should come into the possession of the nation, being now fulfilled by Mr. Watts's important gift of eighteen of his pictures on the occasion of the opening of Mr. Tate's Gallery last summer, the picture, which until recently has been on exhibition at Stockholm, has now been handed over by Mr. J. Fred. Bowman to the trustees of the National Gallery.

"SUMMERDALE," Epsom, illustrated in our central pages, occupies a beautifully timbered site in the Burgh Heath Road, and was erected for Mrs. M. Wood. It is faced with Bracknell red bricks, the upper portion being weather-tiled; the roof is tiled. All the internal joinery is Oregon pine, stained and beeswaxed. The house was designed by Mr. J. Hatchard Smith, 41, Moorgate Station Buildings, London, E.C., Mr. J. A. Jeal, of Epsom, being the builder. "Newdigate Place," which we also illustrate, occupies a commanding site, with beautiful views over Leith Hill and the surrounding country. The external walls are faced with local red bricks, the upper portion being weather-tiled; the roofs are tiled. All the half-timbered work is of oak filled in with plaster; the casements and frames, and doors throughout are also of oak. The hall has an oak, open timber roof, the walls are panelled to a height of 10ft.—a gallery running round two sides—the staircase and balustrading is also of oak, and the dining-room has oak panelling; all other joinery is of Oregon pine, stained and beeswaxed. Messrs. J. and J. Ward, of Warlingham, were the builders. Messrs. Moody Bros. supplied the electric light plant. The decorations by Mr. Garrick, of Reigate. The work has been carried out under the supervision of the architect, Mr. J. Hatchard Smith, of 41, Moorgate Station Buildings, London, S.E.

THE POSSIBILITY OF EXAMINATIONS IN ART.

By A. R. JEMMETT.

YOU will doubtless remember that at the time when the Institute examinations were made compulsory, a certain number of architects raised a protest against them, on principle, some leaving its ranks on that account. Their general attitude, so far as I was able to understand it, was this. You cannot examine in Art. Architecture is an Art, therefore you cannot examine in Architecture, and if you could, this particular examination, as carried out, is of little use to that end. To this I once saw a reply, in the journal which is generally supposed to represent the opinion of the Institute, to the effect that no one ever said you could, that the Institute examines in some of those things which, in its opinion, an architect should know; in those sciences upon which Architecture rests, so that it was time all this talk about examinations in Art was stopped, as being beside the mark. Well, it was stopped; everybody seemed to be agreed and to rest comfortably satisfied that we cannot examine in Art, and moreover don't try to do so. When everyone takes a thing for granted, then is the time to question it. So it might be worth while to consider whether it really is a fact that you cannot examine in Art, or whether it is only a convenient fiction, invented to save trouble, and for reasons which it is not worth while discussing. Now, before we proceed, it is necessary to try and come to some understanding as to

WHAT WE MEAN BY ART,

though I do not propose to attempt to define it exhaustively, in the short space at my disposal. The whole truth cannot be expressed in an epigram, nor Art defined in a sentence; there are, however, some aspects of it which we should do well to consider, as bearing upon the subject before us. Art, as we are told, deals with human emotions; it interprets them and appeals to them. According to Viollet le Duc, "Art is an instinct, a craving of the mind, which, in order to express itself, employs various forms." "Art is the form given to a thought, the artist is he who, in creating that form, succeeds in conveying by it the same thought to the minds of his contemporaries. Elsewhere," he says, "that in order to live, Art must be free in its outward expression, though strictly regulated as regards principles; it dies when its principle is disregarded and its expression enthralled." Now, if Art does appeal to and express human emotions, the artist must remember that the elemental feelings of humanity are always the same, and can always be appealed to in the same way. As Viollet le Duc points out, "the sight of sorrow, the accent of sorrow, the representation of sorrow, will all produce the same feeling, that of pity." He might have added to this, and it always will while human nature remains what it is. Observing this and similar facts, there has gradually been built up on them a language of the Arts, which appeals to these elemental emotions, as well as to the more complex feelings of our more complex existence, by means which experience has shown to be successful. Thus, if the painter wishes to appeal to the sentiment of pity, he paints a representation of sorrow, not of joy; unless he wants to appeal to the cynic, who might pity humanity for being so absurd as to be happy. But then the cynic is not human. So again in Architecture, the effect on the mind of a low, dark, mysterious and gloomy vault is, as the same writer points out, different to that of a lofty hall with

A FLOOD OF LIGHT AND AIR.

The artist, therefore, who wishes to appeal to the emotions naturally aroused by the one method must not employ the other. "To appeal successfully to human sympathy," says Leopold Giddily, "the artist must thoroughly understand the idea which is the cause of emotion and the relation of the audience to

this idea, and he must be a master in all technical expedients needed to create an intelligible picture which shall illustrate the idea." In other words, Art is a language whereby we express our ideas and sentiments, which appeal to human sympathy; if we would wish to be understood—that is, really appeal to others—we must ourselves understand and speak this language correctly; if we do not we must be content to be misunderstood. Vitruvius tells us that this language of the Arts is the result of theory and practice; that theory is common to, and may be known to all, but practice occurs to the artist in his own Art only. Though we may possibly not have here a complete definition of Art, yet I hope it will be allowed that there is nothing contrary to its nature. The cause of most disagreements on matters of Art, is a misunderstanding as to the meaning to be attached to the word. If Art is understood to be simply and solely a matter of fancy or caprice, with no reason and no meaning; if it has neither theory or principles, it is evident that you cannot examine in it, for you cannot find out whether a man knows, when there is nothing to know. But if there is something to be known, which the artist must know before he can create a work of Art, if these authorities just quoted knew what they were talking about,

IF ART HAS PRINCIPLES

and a theory, it is not so difficult to find out whether a man understands them, provided always, that you first understand them yourself. It might help us, to analyse a little the different elements which go to make up a work of creative Art. There is first the emotion to be expressed, then the idea which is to express it, and lastly, the method by which this idea is worked out. As an instance. There is implanted in the human heart, a certain instinctive faith in the unseen, a craving for immortality, "a passionate yearning for the face of God." This instinct may be carefully hidden from sight, may be enervated with a superficial scepticism, but in every normal man there it is, and we will say it is the feeling we would wish to express. The first thing then, is that we sympathise with it, and be able to feel and understand it ourselves; if we are architects, we have then to consider how it can be best expressed in Architecture. The expression of this instinct has taken various forms, according to the various conceptions which mankind has held of the nature of the Deity. We may thoroughly enter into this sentiment, and think we have ideas which would fitly express it in stone, but if our conception takes a form which would have appealed to an ancient Greek, or a Moslem, or to a Frenchman of the thirteenth century, it is evident it will not appeal to our contemporaries, as their conceptions of the nature of the Deity, and of immortality, differ from those of the Greeks, the Moslems, or even the thirteenth-century Frenchmen. So the artist must not only be able to feel the emotion, but he must also be acquainted with the contemporary ideas and conceptions of the subject, so that his idea may take a form which appeals, which will be understood. This religious instinct has, in all ages, found some expression in certain ceremonies, for the due performance of which buildings are required. People collect together in obedience to an idea, the worship of the Deity. Influenced by the sentiment of this worship, they perform certain ceremonies, which ceremonies express the idea, and require that the people should be grouped in certain ways, that there should be room for carrying out such movements as may be demanded. This gives the building its *raison d'être*, and suggests its characteristic form, so that the artist finds a clue, something to start upon. The logical development of this primitive form, by an artist saturated with the sentiment of the subject, is the method by which the idea is expressed in Architecture. If the building is nothing but a shell, large enough for the performance of a ceremony, but not taking its particular form from this ceremony, or group of ceremonies, or if there has been introduced a misplaced idea, which tends to interfere with, or which does not express, the functions of the building, it

can hardly be said to express the main idea, the underlying sentiment or instinct which was the reason for its existence. It is, of course, possible to express and appeal to the particular instinct of worship in other ways than by forms which express the functions of a building, which functions grow out of the ceremony suggestive by this instinct; but this is the architect's way of doing it. Any ideas which do not readily lend themselves to this treatment, and are not suggested by the necessities of the case, are better expressed in some other medium, such as poetry or music. Imagine a man equally gifted in all forms of artistic expression. Though we might possibly be able to imagine this, we could never imagine him spending twelve months of his time and thousands of pounds of other people's money, and worrying through all the practical business details necessary to get a building put up, just for the sake of an idea which he could have expressed so much easier and quicker in four lines of poetry or a few bars of music. It would not be reasonable, neither would it be artistic. But there are some ideas, some feelings, that are

BEST EXPRESSED IN ARCHITECTURE,

that cannot be fully expressed in any other way—those thoughts that lie too deep for words. So that the artist should know the possibilities and limitations of expression of which his Art is capable; what ideas, what emotions are most appropriate to his particular method of expression; lest he should one day be discovered uniting the Iliad in terra-cotta, or infusing the sentiment of the moonlight sonata into a jam factory. Now the question is, How far is it possible to examine—that is, find out how much a man knows of all these things? First, does he know what he has to do, and secondly, can he do it? It seems to me that as far as the nature and functions of Art are concerned, that the matter presents no difficulty. An artist expresses human emotions? Does he know what they are? Does he feel them himself? If not, how can he express them? Does he know how to appeal to them? If not, how can he do it? If he is an architect, does he understand the method whereby the idea and the sentiment of any building is to be expressed? Does he know the underlying idea which causes people to assemble in a church, a court of justice, or theatre? Is he acquainted with the way in which the procedure in these buildings governs their outward form and appearance, of how to get at the characteristic sentiment? If not, he is liable to produce such buildings as we see all over London—features appropriate to a theatre put on a bank or a town hall; cherubs heads on

A DESIGN FOR A WAR OFFICE;

or, perhaps, the same character of detail, with the same feeling, spread impartially over every building, quite regardless of its natural sentiment. In all this I should think it was possible to teach and as possible to examine. For these things are not a matter of individual fancy. During the last few centuries, since Architecture got out of touch with life, most buildings in this country have ceased to express any definite idea or sentiment whatever. The general practice seems to have been to put up a structure which could, without much inconvenience, be used for the particular purpose required, without any attempt to let its general setting out, grouping, and construction express the idea. Artistic expression, where such was desired, was supposed to be obtained by the introduction of sculpture. A group, say, of Charity relieving human suffering, over the entrance to a hospital, or a blindfolded female with a sword and a pair of scales over a police court, were understood to express the idea of the building. But where the general character of the hospital suggests

A ROW OF TOWN MANSIONS

it would be much simpler and clearer to write up instead "This is a hospital," because then there could be no mistake. The mind would no longer be bewildered between the two different sentiments, one expressing town mansion, the other hospital. These four words, as

A paper recently read before the Discussion Section of the Architectural Association.

expressing the nature of the building without any doubt, might be considered more artistic than the sculpture, even though carved by Michael Angelo himself. I, for one, think they would be so. In most of our public buildings the legend written over the door is the only bit of artistic expression about them. It looks as if the aim of most designers was to treat the outside of the building just as fancy dictates, to give it such forms as please our taste, and then to say, "I like it and my particular friends like it, they think it clever, even original; what more do you want, what more is required for fine art? If you don't like it, why, all the worse for you, evidently you are not an artist." To this the only possible reply is, that if he knew more about it he would no longer like it. Now, if we talk to such a man about examination in Art his sensitive soul is shocked. Ask him why he does such or such a thing, he says he doesn't know, and he doesn't want to know, that he works at the bidding of his own proper instincts or something equally enlightening; ask him what they are, and his pity for you is too deep for utterance. In fact, he is quite delightful, and evidently a wonderful genius. The only thing to regret about him is his ignorance of himself, his fellow creatures, Art, Nature, everything. Now, it may be difficult, or even impossible, to examine a man in this sort of thing. If possible, it certainly is not worth while; but we must not forget that whatever we pleased to call him, at no other period in the world's history, and even now, perhaps, in no other country but this, would he

BE CALLED AN ARCHITECT.

The only parallel to such work that I am aware of, is that of the ruins of Central America, which, funnily enough, such men do not admire; rather do they admire a thirteenth century cathedral, a building evolved from principle, not caprice, whose architect would certainly never acknowledge us as brothers in Art while we work on such lines as this. Any disbelief in the possibility of examination, on the part of those whose chief interest in Architecture is emotional; may be traced, perhaps, to an objection to being tied down to any definite rules, which examinations would admit, as you must have some definite standard by which to examine. This attitude of mind seems to rest on a confusion between principles and formulae or cast-iron rules; the confusion is so general that it is not to be wondered at. According to the dictum of Viollet le Duc, already quoted, Art must be free in its outward expression, though strictly regulated as to principle. If, then, an examination was confined to matters of principle it could not interfere with the individuals freedom of expression. As an instance of what I mean. In a Greek temple, the vertical lines on the columns and triglyphs accentuate, or make still clearer, the idea of support already expressed by these features before they were decorated. The general principle is, that all such ornament, and anything not absolutely required by the structure, should have a similar end in view, viz., to draw out, or to heighten,

THE EXPRESSION ALREADY INHERENT IN THE STRUCTURE;

not to add a different or new expression. This is a principle which all Architecture follows; but if we said that, whenever it is required to accentuate a point of support, we must always do it, like the Greeks, with vertical lines, that would be a formula which we are not bound to follow—we can do it how we like, so long as we do it; but in attempting any novel treatment of our own, we must see that we keep the right end in view. If an examiner were to insist that all supports should be decorated with vertical lines, I can understand that an artist, who valued his freedom, would object; but if the examiner simply insisted on the principle, and allowed the artist perfect freedom in its application, I cannot see any rational objection; at any rate, I cannot see where the impossibility comes in, provided, as I said before, the examiner knows the principles himself. We are rather apt to

forget nowadays that, though Architecture appeals to the emotions, the process whereby we obtain this result is not an emotional process. It is evident that no amount of emotion could build either the Pantheon or Westminster Abbey. Take music, as an example—the complimentary Art to Architecture. An Art, the most emotional of all, perhaps, a theory the most mathematical and precise. In this Art they examine, and examine successfully, because the examiners all know the theory, and are agreed upon its principles. Why cannot we do the same, if we think it desirable? Take acting again; you appeal to the emotions, but you do it by certain means which are not chiefly emotional. Certain gestures, certain tones of the voice, appeal to certain feelings—you have to learn this before you can act properly. If you behaved naturally on the stage, the effect would not appear natural to the audience. Every time an actor gets an engagement with a manager to whom he is unknown, he has to go through what is practically an examination by this manager, who can find out what he knows about his Art, and also what his natural capacity is for making use of what he knows. In any Art

THE ELECTION TO A SOCIETY,

or the conferring of a medal, is practically the result of an examination by those who elect. In Architecture we have now an examination at the Institute, which, as I said at the beginning, I understand is directed to find out whether you know certain things which, in the opinion of the examiners, you ought to know; but which does not profess to gauge your knowledge of Art, or your attainments as an artist. I may be wrong in this, and I must confess it is difficult to exactly appreciate this position; but what does seem clear to me, from the papers I have had an opportunity of studying, is this—that it would be difficult to frame an examination which more skilfully avoided those things which you must know if you would be an architect, viz., the principles of your Art. Would it not be possible to make this an examination in Art by asking for reasons and principles rather than for facts? They ask how certain things are done; suppose they ask how they should be done, and why? That is the important thing to know. In the history of Art, which I think an artist must know, they sometimes ask for a list of the works of some celebrated architect. Would it not be better to ask for his point of view, so to speak; his method of reasoning; his position as compared with others, if it is thought advisable to ask anything at all about him? With regard to any great man, what he did is not as important as why he did it. Again, they ask for features taken from various styles, but they don't seem to ask their meaning. Instead of drawings of classic cornices and other details, and Gothic door jambs and window heads, suppose you were asked to take two such typical buildings as

A GREEK TEMPLE AND A GOTHIC CATHEDRAL,

each of the best periods, to analyse them, and point out how the same principles were worked out in each, the reasons for the form of the plans, and why they are different; the various aims and methods of reasoning of the Greeks and medievalists, and the means they adopted to express the sentiment of the subject. Instead of having to draw an exact plan of St. Sophia or the Parthenon, suppose you were asked for sketch plans and sections of a typical Greek temple, a Byzantine church, a Roman basilica, an Italian villa, a Venetian Gothic palace, a thirteenth century cathedral, a town hall of the same date, etc.—not actual examples, but the type. While this examination includes a design, to be done to the satisfaction of the examiners—whatever may be intended by it—it can still be discussed as an examination in Art. If these designs are judged by the standard of taste of the examiners, their value is an unknown quantity; but if they are judged by the immutable principles of Art, why is not the rest of the examination run on the same lines? I cannot help thinking that if the principles of the thing are understood, it is possible to examine and place a design, in so far as it carries them out. The worst of

it is, that if we once begin to reason about anything in this world, we never know where we shall get landed, or to what startling and unpleasant conclusions we may not be forced. With regard to this examination, it is difficult to avoid one of two conclusions; either the Institute thinks a feature of more importance than the reason or principle which dictated it, or else they don't ask for these reasons and principles, because they don't know them. Which of these two conclusions is the most absurd? But though I believe in the possibility of examination, I would like to draw a distinction between the possibility and the advisability, also between the possibility at one time, as distinct from that at another time. It seems to me that at those periods

WHEN ART HAS BEEN MOST ALIVE, there has been a large consensus of public opinion controlling it, as in the days of Pericles. In such days, the artists were not only agreed as to principles, but also as to the forms in which these principles should find expression. An examination would then have been the simplest thing; but at the same time, and for this very reason, quite unnecessary, for besides the artists, who would naturally bring every youth up in the way he should go, there was so high a standard of public interest and knowledge, as to render an artistic importer impossible, he could never have made a living. I fancy that if anyone had attempted to erect on the Acropolis, such monstrosities of unreason as we can see around us, he would have been thrown over the walls, if he wasn't executed for high treason. So that when an examination is most possible, it is, at the same time not necessary. On the other hand, at those times when Art does not flourish, when the public will tolerate anything, and an examination seems advisable to keep out the imposter, and to prevent the lamp of Art from flickering out altogether; it is just at this time, and again for this reason, that it is most impossible; as there is not a sufficiently large body of artists—all agreed as to principles—to enforce their standard upon the rank and file. So that, I take it, when examinations are necessary, they are not possible; and when possible, they are not necessary, which I hope you will consider a satisfactory conclusion.

THE Archbishop of Capetown proposes to build a new cathedral at Capetown at a cost of £120,000.

THE catacombs of Rome are to be lit by electricity. Now we shall see the frescoes of the burial chapels as we rarely see the pictures in the National Gallery.

THE congregation of Kingston Vale Church are going to erect a reredos in memory of the late Duchess of Teck, and Mr. Bodley has been entrusted with the designing of the work.

To perpetuate the memory of the fourth Marquis of Downshire, it is proposed to lay down a new chancel floor of marble in Hillsborough Church. A large statue of the Marquis, erected by his tenantry and friends, stands facing Hillsborough Church.

THE Building Committee of the Bradford City Council have passed amended plans for the proposed new theatre in Great Horton Road. The plans show improved means of circulation and egress as compared with those originally submitted.

THE annual dinner of the architectural staff of H.M. Office of Works, 15, Whitehall Place, was held on Wednesday, January 25th, at the Commodore's Salon, Holborn Restaurant. The chairman, Mr. Henry Tanner, F.R.I.B.A., was supported by Mr. W. T. Oldrieve. The toast of the Queen having been drunk, a musical programme was gone through, all the performers being members of the staff. The songs by Messrs. Reavell, Houlst, and Neubronner, and the violin solos by Mr. Creswell were especially applauded. The toast of the chairman, proposed by Mr. Leverton, in a witty speech, was enthusiastically received, Mr. Tanner's reply meeting with a similar reception. The toast of Mr. Oldrieve and the Dinner Committee, proposed by Mr. Reavell, concluded the list.

THE TOWER BRIDGE.

THE Bridge House Estates Committee have presented to the Corporation a report in relation to the erection of the Tower Bridge—a work intrusted to them by the provisions of the Corporation of London (Tower Bridge) Acts of 1885, 1889, and 1893. When the royal assent was given to the Act, it was agreed to employ Sir Horace Jones as architect and Mr. (now Sir) J. Wolfe Barry as engineer of the bridge at a remuneration of £30,000, to be divided between them in such proportions as they might mutually arrange, such sum to include all expense of superintendents and clerks of the works, but not Mr. Barry's remuneration for Parliamentary services. Sir Horace Jones died in June, 1887, and an arrangement was made between his executors and Mr. Barry for the latter to undertake solely the duties of the undertaking. Mr. Barry was eventually paid £12,000 for additional services. A considerable quantity of property had to be taken and paid for under the powers of the Act, including Queen Elizabeth's Grammar School, Hartley's Wharf, St. Olave's Grammar School, and other buildings. In carrying out the construction of the bridge,

THE WORK WAS DIVIDED

into separate contracts, viz., for the construction of the piers and abutments (Mr. John Jackson), £147,279; the northern approach (Mr. Jackson), £59,001; the cast-iron parapets of the northern approach (Mr. Jackson), £6418; the southern approach (Mr. William Webster), £39,327; the hydraulic machinery of the bridge (Sir W. G. Armstrong, Mitchell, and Co.), £98,962; the iron and steel work of the superstructure (Messrs. W. Arrol and Co.), £349,959; the masonry and brickwork (Messrs. Perry and Co.), £149,122; the paving and lighting (Messrs. Perry and Co.), £30,333; gates, rails, and heating apparatus (Messrs. W. Sugg and Co.), £4793; signalling and interlocking apparatus (Messrs. Saxby and Farmer), £8326; construction of reservoir (Messrs. J. Mowlem and Co.), £2164; and other smaller contracts.

THE ARCHITECT'S ORIGINAL INTENTION

was that the towers of the bridge should be of masonry alone, but, owing to the weight, it was decided to construct iron pillars at the angles of the piers, braced together horizontally and diagonally, and surrounded by masonry. That alteration entailed a considerable additional expense. The Prince of Wales laid the foundation stone in the name of the Queen on July 21st, 1886, and the bridge was opened on June 30th, 1894, by the Prince on behalf of Her Majesty. As evidence of the admirable construction of the bridge, it was a source of gratification to the committee to state that since the opening only thirteen interruptions to the land traffic had occurred by reason of any fault in the machinery, and these delays averaged six minutes each. No interruption to the river traffic had occurred through any defect in the machinery. In view of the intricate nature of the machinery, the large amount of traffic that passed through and over the bridge, and bearing in mind that the structure was the largest bascule bridge in the world, the committee thought the Corporation had every cause to be satisfied with the construction and general working of the bridge.

A NEW high school for girls, which has been erected at a cost of £7000, and will accommodate 200 pupils; has been opened at Shrewsbury. The Linton Memorial Schools, which have been erected in the parish of St. Peter le Bailey, Oxford, on a portion of the site of the old New Inn Hall, cost nearly £4000.

A PAPER will be read by Mr. Geo. Ellis, "On the Structure and Properties of Timber," before the members of the Institute of British Carpenters, on Saturday next, in Carpenters' Hall, London Wall.

HERR REINHOLD BEGAS, the well-known German sculptor, has been adjudged the winner in the competition initiated by the Government for a monument to Bismarck, to be erected in Berlin. His was the only really practicable design submitted.

Professional Items.

BRISTOL.—The new boys' school at Eastville is situated in the upper part of Eastville. In the centre of the building is a large rectangular assembly hall, with eleven class-rooms and a couple of cloak-rooms surrounding it. Some of the class-rooms are for fifty children, and others for sixty; and the total number for which the school is built is 600. There are entrances from each end, with a cloak-room and lavatory by the side of the corridor leading into the assembly hall, and into this central hall the class-rooms open. The building is of pennant with Bath stone dressings, and the roofing is of Broomhall tiles. A ventilating turret rises above the assembly hall. In the interior the rooms are supplied with a dado of glazed bricks. The designs were by Mr. E. W. Barnes, of Guildhall Chambers, Broad Street; and the contractor is Mr. J. Browning, of Fishponds. The work, which was commenced in July last and recently finished, cost £6000.

GLASGOW.—St. Patrick's new church, in the Anderston district of Glasgow, is situated at the corner of North Street and William Street, and takes the place of the present church in Hill Street, Anderston, which has stood there for half a century or more. Designed in the Early Decorated style, the new building is a pleasing addition to the architectural features of the district. The nave is divided into seven bays, and is 102ft. long by 30ft. wide. Including aisles, the total width is 59ft. The clerestory is supported by three arches of a span of 27ft. These arches are supported by granite columns, so that two columns practically support the weight of the clerestory on either side. The effect of this is that it enables nearly the whole of the congregation to see the high altar. In each of the seven bays of the clerestory is a five-light window with traceried head, and in the bays of the aisle, on the epistle side, are two two-light windows with traceried heads. The great west window is divided into seven lights, with richly traceried head, and is 32ft. high. The baptistery is placed at the end of the aisle on the gospel side. The roof, supported by six principals, has a total height, from floor to ridge, of 67ft., but is ceiled internally at a height of 57ft. The internal length of the church is 134ft. Accommodation is provided for over 1000 worshippers. There is ample sacristy accommodation. The church and presbytery are built of Locharbriggs stone, the roofs covered with slates from the Aberfoyle quarries. The church has been erected at a cost of £9000. Both church and presbytery are lit by electric light. The whole has been designed and carried out under the direction of Messrs. Pugin and Pugin, of London.

HALIFAX.—Plans for the Halifax Public Hall, which is about to be erected by a limited company, have been prepared by Mr. W. C. Williams, architect. The site is the top corner of Commercial Street, at its junction with Wards End and Fountain Street. Being at the junction, as it were, to five roads, namely, Commercial Street, Fountain Street, the New Skircoat Road, Horton Street, and Trinity Road—which lead to all quarters of the district—the site could not well be surpassed, and the building will be an addition to the architectural adornments of the town. The plans show a large hall 71ft. wide, 118ft. long, and 60ft. high. An orchestra, with a depth of 38ft., is provided. There are two galleries, the first tier being for the grand circle and the second for balcony purposes. The end of the hall opposite to the orchestra will be circular in form, so as to add to the acoustic properties, and the ceiling will be cambered. Beneath the orchestra, and also on the grand circle level, there will be retiring-rooms. The accommodation provided for in the plans is 2549, namely, auditorium 870, grand circle 560, orchestra 365, balcony 754. Cloak-rooms, refreshment-rooms, and lounges are provided. The hall proper will be on the

Powell Street side of the ground, and shops will be erected on the Commercial Street frontage and also round the Fountain Street corner, the grand entrance being at the junction of Fountain Street and Commercial Street. The hall will be lighted by a clerestory on the balcony level. There will be a lecture theatre, with accommodation for 301 persons, on the centre corner of the site, with access from the grand entrance. The plans provide for a restaurant underneath the grand entrance-hall, with the windows overlooking Fountain Street. The style of Architecture adopted is English Renaissance.

HARROGATE.—It has been decided to erect a first-class opera house at Harrogate. The plans are by Mr. Matcham, and the work is to be commenced during the coming spring.

LIVERPOOL.—Water Street knows the White Star Line no more. In short, the firm of Messrs. Ismay, Imrie, and Co. has outgrown its old offices; and the business will henceforth be carried on in the palatial edifice at 30, James Street. The huge pile raises its lofty head high above all existing buildings in the vicinity. Somewhat of the French—or, perhaps, Free Continental—style of Decorative Architecture has been adopted. But, although possessing the free, light characteristics and adornments of the French style, the general impression is one of fortress-like British solidity, and is suggestive of all that is substantial. Indeed, the style is unique, the two tourelles, from the southernmost of which the large two-faced clock depends, being particularly striking. In hastily glancing over the exterior of the building, the spectator is impressed with the rough, uncut granite foundation, suggestive of enormous sustaining power; the splendid Norman-arched entrance in James Street; the curiously low-set entresol forming the first floor, which seems somehow or other to balance the loftiness of the building; and far above the various balconies, the innumerable windows, and the lofty watch-tower, are points which at once attract the attention of all passers by. The architect who designed the whole structure was Mr. R. Norman Shaw, assisted in Liverpool by Mr. J. Francis Doyle, who has been responsible for the carrying out of the work. Ascending the broad flight of granite steps at the main entrance, the first thing that claims attention is the handsome pair of cast-iron gates, which are both of a massive and artistic character. At the top of the steps there is a second pair of swing doors, which are upholstered in pigskin, with plate-glass windows, and on each side of which are tastefully designed bronze columns. Entering the vestibule, there is the solid and artistically designed Portland pavement, set off with green marble. On the right hand is situated the electric passenger lift, by which access can be gained to any part of the building. Immediately on the left, and surmounted by a Norman Aberdeen granite arch, is another pair of swinging doors, also upholstered in pigskin dyed red, and with cut-glass windows, leading to a splendid apartment, suggestive rather of the hall of an exhibition than a shipping office. This is on the ground floor, and it contains 480 square yards, being 60ft. in length and about 55ft. wide. From the doorway to the massive walnut and glass partition, which separates this general office from the partners' rooms at the east end of the hall, is a clear avenue 13ft. in width, paved with an india-rubber flooring of artistic design. In the centre of this avenue there stands a model of the Majestic, fully armed as a war cruiser. On each side there are massive mahogany counters resting on a foundation of polished Hoptonwood stone, elegantly curved, and surmounted by thick grained-glass screens. The ceiling forms an interesting novelty in the general contour of the building, being formed in a number of small arches composed of terracotta Ruabon tiles of buff colour. The main supports—square iron pillars—may be described as of an iron colour; indeed, by some clever combination of colours in the roof, floor, and walls, the suggestive impression from an

artistic point of view is that of iron. Hence, perhaps, the general idea of substantiality which pervades the building. The walls are throughout wainscoted in walnutwood paneling, and the fittings are also constructed of this wood, with mahogany desks on top. For the general office light is obtained by three large windows on either side, all of which are doubled, to deaden the sound of outside traffic. Around the walls are hung six of the well-known White Star pictures, by W. L. Wyllie, A.R.A. The system adopted for the heating of the entire building is the "Ideal." A handsome spiral staircase leads from the main entrance right up to the top of the building. Altogether, the new White Star offices may be classed without exaggeration as an example of unique Architecture externally, and as a model of comfort, luxuriousness, and utility within.

MELINCRYTHAN.—The Llantwit Lower School Board has recently accepted the tender of Mr. A. George Neath, amounting to £5120, for the erection of the new schools at Herbert Road, Melincrythan. The schools will have accommodation for 620 children, with the ground floor arranged for infants, having one large schoolroom, two class-rooms and marching space, and the first floor arranged for the mixed department with central hall and six class-rooms, together with masters' and mistress' rooms, and cloak-rooms conveniently situated. The building is to be of Morriston brick with Bath stone dressings, and will be a great architectural feature in the district of Melincrythan. The architect is Mr. J. Cook Rees, Neath. The duties of Clerk of Works have been entrusted to Mr. D. Wagstaff.

NEATH.—A fine block of business premises has recently been completed at New Street Square for Mr. B. W. Davies. The main elevations are faced with Ruabon red-pressed bricks, with Bath stone dressings. The ground floor has been arranged for spacious shops, which have been elaborately fitted up. The first and second floors are intended for offices, with all conveniences for each suite. The buildings were designed by Mr. J. Cook Rees, Neath. The work was intrusted to Mr. Abraham George. The clerk of works was Mr. Samuel Banbury.

OLDHAM.—The Corporation scheme to effect a large number of municipal improvements at a cost of over £200,000 has been defeated. Borrowing powers would have been asked for £339,000, and the scheme would have included the municipalisation of the tramways, extensions of the markets and Westhulme Hospital, the adoption of the water carriage system, the erection of a wide road bridge over the railway valley, and several street improvements.

SALFORD.—The Guardians have adopted a report of the Building Committee, who recommended the Board to authorise them to make an offer of £14,000 for a plot of land at Hope, containing about twenty acres, adjoining land already in possession of the Guardians, as the site for the proposed new workhouse for the Union.

SHEFFIELD.—The Central Free Library in Tudor Street and Surrey Street has been opened after undergoing extensive alterations and improvements. The principal alteration has been the utilising of the old Council Chamber, which has been turned into a public reading-room. This room, which in the old days was always dingy, has been thoroughly cleaned, and the walls painted a nice green shade of colour. In future it will be lighted by electric lamps. That portion of the old Council Chamber formerly set apart for the accommodation of the public interested in the debates has been fitted up with desks to hold bound volumes of the illustrated magazines. The old reference library has been transformed into a reading-room for ladies. The electric light is also laid on here. Close at hand is the office of the chief librarian, also used as a meeting place of the Free Libraries Com-

mittee. The alterations made in its interior arrangements have secured greater economy of space and a much neater appearance. From the librarians' office a spiral staircase leads down to the officials' counter in the reference library. This was formerly the old reading-room, but it has been very nicely fitted up for the purposes to which it will henceforth be devoted. Busts of James Montgomery, Ebenezer, Elliott, and Homer have been unearthed from dim recesses, and now occupy places of honour in this resort of the studious. The lending department will still be in its old situation, but, in common with the rest of the building, the room has been brightened up, and made more presentable and better adapted for the use of both officials and the borrowers of books. The structural alterations have been carried out by Mr. Newbold, of the city surveyor's department, and under the direction of Mr. C. F. Wike, the city surveyor.

SKEGNESS.—It is proposed to erect a new chapel at Skegness, and tenders have just been opened for the carrying out of the work. That of Mr. Todkill, builder, of Sutton Bridge, has been accepted. The amount of this tender was £1800, and the next was £2000, the amount of the highest tender sent in being £2450.

STOKE.—The new operation rooms at the North Staffordshire Infirmary have recently been opened. The foundation-stone of the Infirmary was laid by the Prince of Wales in 1866, and at the time of its erection its design and construction were fully up to date, but during succeeding years great progress has been made in sanitary arrangements and appliances, which have from time to time been followed by the committee. The last of such improvements has been accomplished by the re-modelling of the operation room and in providing anæsthetic and sterilising rooms. The points gained in this work have been the provision of a better approach to the operation room, facility in the treatment of patients undergoing operations, and the convenience and comfort of the operating surgeons. Also the facility for effecting perfect cleanliness in every part of the operating room and its adjuncts and the provision of suitable and ample lighting throughout these rooms. All the old fittings are replaced by suites, wash basins, and shelves made specially by Messrs. Twyford's Limited, the flooring being of terrazzo and the walls of specially-made tiles by Messrs. Wedgwood and Sons. The alterations have been carried out by Mr. T. Goodwin, builder, from the designs of Messrs. Lynam, Beckett, and Lynam, at an estimated cost of £1000.

TRURO.—In place of the old British Schools at Truro, which were condemned about three years ago, new buildings have been erected on a site between Bosvigo Lane and Chapel Hill, by Clemens and Battershill from the designs of Mr. S. Treval, the contract price being £1682. Accommodation is afforded for 450 children, who will have the advantage of spacious playgrounds surrounding the school.

WALSALL.—Public improvements have occupied a good deal of attention in Walsall of late. George Street, one of the old narrow thoroughfares, has long been marked for widening and improvement, but difficulties, which up to a very short time since seemed insuperable, stood in the way. Skilful negotiations have, however, resulted in the adoption of a scheme whereby the thoroughfare at the most constricted part is to be widened by several feet, at a cost to the town of £850. Then a sub-committee has been appointed to consider and report upon the character of the buildings to be put upon the land in Lichfield Street, bought as the site of a town hall and municipal buildings; and another to seek out a site for an infectious diseases hospital. Further, there is now a prospect of the 1700 square yards of land at the end of Park Street, which remain from the Artizans' Dwellings Act scheme some twenty years ago, being utilised.

Under Discussion.

THE WINTER SESSION.

ETRUSCAN AND ROMAN WORK.

A paper on Etruscan and Roman work was delivered before the Architectural Craftsmens' Society of the Glasgow and West of Scotland Technical College, a few evenings ago, by Mr. D. Bennett Dobson. He showed the origin of the Etruscans, tracing them back from being the descendants of the Pelasgians to the ultimate development of the Roman nation. He dealt very fully with their work, as exhibited in their tombs of different kinds, showing also how they originated and improved on everything, even in science and arts. They invented the arch long before the Romans existed. Mr. Dobson then led up to the founding of the Roman Empire, and showed fully all the various buildings of the Romans—her temples, theatres, baths, and monuments, illustrating his paper by lantern views.

THE ROMAN CAMP AT ARDOCH.

The monthly meeting of the Society of Antiquaries of Scotland was held at Edinburgh, Mr. J. Balfour Paul in the chair. The meeting was entirely devoted to the reports on the excavation of the Roman station at Ardoch, in Perthshire, undertaken by the Society in 1896-97. The secretary, Dr. D. Christison, reviewed the various notices of the Roman camp at Ardoch, from the earliest in 1672 to the latest in the statistical accounts, all being more or less vague and unsatisfactory. He then proceeded to describe the fortifications, which, owing to complexity unknown in other Roman works at home or abroad, have given rise to much speculation, but as no trace of occupation subsequent to that of the Romans had been revealed by the excavations, the fortifications, complex as they are, must be regarded as the outcome of Roman military engineering.

MELLIFONT ABBEY.

At a meeting of the Architectural Association of Ireland, Mr. J. Howard Pentland in the chair, Mr. Anthony Scott delivered a lecture on Mellifont Abbey. The lecturer dealt most exhaustively with the subject of this fine old Cistercian foundation. Like all remains of the kind in Ireland, it is entirely ruinous. The lecturer illustrated his remarks by numerous measured drawings and sketches, prepared by Mr. Scott, jun. He entered on a comparison and analysis of the plans of Mellifont and the contemporary Cistercian abbeys of France. Mellifont boasts a remarkable feature in the shape of an octagonal detached building, generally supposed to have been the lavabo or baptistery. The lecture was illustrated by a number of lantern views from photographs taken by the members on the annual excursion. We hope to publish Mr. Scott's paper with the illustrations very shortly.

THE ARCHITECTURE OF MICHAEL ANGELO.

Before the Liverpool Architectural Society, a paper was read by Mr. Beresford Pite on "The Architecture of Michael Angelo." Mr. Pite said that the accepted verdict of architectural historians and critics was that Michael Angelo's influence was detrimental to Architecture. He then enlarged upon the extent and reasons of Michael Angelo's influence, the great architect's mastery of the arts of design in sculpture and painting, and the noble character of his intellect. The importance of St. Peter's at Rome was emphasised. Imitative followers without his powers or opportunities came after him. His practical faith in the unity of art was evidenced in his work in the three directions of sculpture, painting, and Architecture. There were the Madonna in San Lorenzo, in Florence, and the Pieta in St. Peter's in sculpture, and the figures of the ceiling of the Sistine Chapel in painting, which were instanced as having a basis of

constructive design, and expressing ideas of scale, grandeur, breadth, and dignity of line in composition. Those qualities also existed in Michael Angelo's architectural designs. Towards the close of his interesting paper, Mr. Pite referred to the length and variety of Michael Angelo's life, and the quiet power of persistence which the great artist possessed.

THE BUILDING TRADE AT NOTTINGHAM.

The seventh annual meeting of the Nottingham Master Builders' Association was held at the Chambers, Bentinck Buildings, Wheeler Gate, when Mr. James Wright, the vice-president, presided.—Mr. Frank Hodson, hon. secretary, and Mr. J. W. Woodsend, the treasurer, respectively presented their reports of the past year's work and finances, both of which showed that the Association was in a progressive and solvent state. The hon. secretary, while congratulating the members on the continued activity in the building trade, regretted the restless state of the labour market, and stated that notices had been received of further demands from the masons and labourers for an increased wage and shorter hours.—Hearty votes of thanks were passed to the officers for the past year. The following were unanimously elected as officers for the ensuing year:—Mr. James Wright, president; Mr. William Edgar, vice-president; Mr. J. W. Woodsend, treasurer; Mr. Frank Hodson, hon. secretary.

-MATTERS' ARCHÆOLOGICAL.

The fourth meeting of the session of the British Archaeological Association was held at Sackville Street, Piccadilly, Mr. C. H. Compton, V.P., in the chair. An interesting collection of articles connected with Roman cinerary interments were exhibited by Mr. Earle Way, consisting of a fine cinerary urn, terra cotta lamps, vases, a tear bottle, and other relics. A fine example of a Celtic bronze coin was found with the above remains, which bears on its obverse a representation in relief of the head of a chief, and on its reverse the head of a boar, with circular and half-circular symbols, in resemblance to what is known as ring money. The coin was found with other coins of Nero Claudius. All these remains were discovered in the course of excavations in the Borough High Street, Southwark, in a line running direct west from St. George's Church to Gravel Lane, Blackfriars, and would appear to indicate the site of a Roman cemetery to which the dead were brought for cremation from the city within the walls on the north side of the Thames.—Mrs. Collier exhibited a very curious pipe bowl, with carving of Burmese character, but suggestive of European influence, probably derived through the Portuguese. She also submitted a small wooden box, of oval form, and apparently of Irish origin, with heraldic carving on the lid, and a shield bearing a harp, and surmounted by a crown, and supported on either side by quaint animals, resembling a lion and unicorn.—Mr. Gould exhibited a series of old woodcuts from Titus-Sivius' history of Rome, which were printed in Strasbourg about 1507.—A paper upon some ancient houses near Halifax was read by Mr. W. D. Hoyle. The houses described and illustrated were Shibden Hall, Shibden Grange, and High Sunderland, all situated within a mile of the ancient town of Halifax. Shibden Hall is a very picturesque, half-timbered house, some portions of which are of fourteenth century work.

M. CORDONNIER, the sculptor, has finished the Pasteur monument for the town of Lille. One of the allegorical figures on it represents inoculation for rabies, and was exhibited at the last Salon.

The tender of Messrs. Woodman, Hill, and Co., of Gosport, has been accepted by the Admiralty for carrying out extensive work in connection with the defence of Portland Harbour against torpedo attack in time of war. To inclose and securely safeguard the harbour will cost about £650,000, and the work will not be completed until about March, 1901.

Correspondence.

THE BUILDING TRADES EXHIBITION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I am constantly receiving enquiries as to the Building Trades Exhibition, which your readers presumably think is to be held in March of this year. Will you kindly allow me to state that this exhibition will not be revived until March, 1899.—Yours faithfully,

H. GREVILLE MONTGOMERY.
The International Building Exhibition.

Enquiry Department.

THE DIMENSIONS OF CHIMNEYS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be greatly obliged if you would explain how the dimensions of chimneys are obtained in Banister Fletcher's book, pages 254 and 255. The examples of measuring chimney stacks are given. Also please say if this is the general method.

"STUDENT."

Professor Fletcher's method of obtaining the dimensions of chimneys is as follows: The concrete and footings are taken first, then brickwork floor by floor taken by the foot super, describing the thicknesses and deducting only the opening for fireplaces, the flues being measured in as if solid, and afterwards numbered for coring and pargetting. This is fully explained on pages 19 and 20 of "Fletcher on Quantities." Angle chimneys are measured as solid, and afterwards reduced to the ordinary standard, and the extra labour is afterwards taken as shown on pages 254 and 255. In reply to the further question this may be called the general method.

CROSSES ON GABLES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be glad if you would kindly answer in your enquiry column the following query: Would it be wrong to place crosses upon gables of a Gothic cemetery chapel (which is not intended to be consecrated)?—Yours, etc.,

"GOTHIC."

We have laid your enquiry before one of our best authorities on Ecclesiastical Art, who has sent us the following reply:—There is no reason whatever against putting crosses on gables even though not consecrated. The cross is placed merely as a symbol of the Christian faith and does not imply that there has been any ceremony of consecration. It is merely a question of design. As a general rule one cross only should be used in a small building. More look funny and detract from the general effect.

THE SOCIETY OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you please inform me through your enquiry column the requirements of the Society of Architects, so that a student may become a member; also the address of the secretary? Are there any examinations for students? and, what is the difference from the R.I.B.A.? Thanking you in anticipation. Yours truly,

"ASPIRANT."

To quote the rules of the Society of Architects, "Members shall be gentlemen who are or have been directly engaged professionally in architectural pursuits, and shall be above 21 years of age." "Associates shall be gentlemen who have obtained some distinction in literature, science, and art, connected with Architecture, and shall be above 21 years of age." "Honorary members shall be gentlemen of distinguished attainments, and shall be nominated by the Council." The entrance fee for members and associates is two guineas, the annual subscription being one guinea. With regard to examination, the rules state that: "Subject to confirmation by general meeting, the Council shall select, from time to time, certain examinations, which shall be deemed qualifying examinations for membership of the Society; and election to membership shall be

only open to candidates, approved by the Council, who have passed any one of such examinations, or an examination held by the Society, with the following exceptions: (a) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits, as principals, for at least seven years. (b) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits, as assistants or as assistants and principals, for at least ten years." We understand, however, that the scheme of examination is still in abeyance, although it is hoped that before long the time and conditions of the examination will be permanently settled. Further information, together with copies of the rules and regulations and forms for nomination of members, will be furnished by the secretary (Mr. Montagu Baldwin, M.A.), who should be addressed at the office of the Society of Architects, St. James's Hall, Piccadilly, W.

MUNICIPAL ENGINEERING.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you kindly inform me the names and prices of the books that should be studied for the "Incorporated Association of Municipal and County Engineers" examination.—Yours, etc.,

R. W.

We are informed that the examiners do not recommend any particular text-books, as it is desired to make the examinations rather a test of the candidate's practical knowledge of the subjects generally, than to find his acquaintance with any particular book or books. We cannot, therefore, in the spirit of the examination, recommend text-books. Your greatest prospect of success would seem to lie more in a practical acquaintance with subjects of the examination—engineering as applied to municipal work, building construction, strength of materials, sanitary science as applied to terms and buildings, and municipal and local government law as relating to the works of municipal engineers and surveyors, upon which subjects numerous general works are obtainable.

THE R.I.B.A. COMPETITIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Is it necessary to be a student of the R.I.B.A. before one can compete for the Institute's prizes, scholarships, &c.? I know it to be a condition of the Surveyor's and Civil Engineer's Institution, but am not certain about the R.I.B.A.—Yours faithfully,

"PUPIL."

We understand it is not necessary to be a student of the R.I.B.A. before competing for the prizes and scholarships. A small pamphlet, published every year, when the subjects for the prizes are announced, gives the conditions with which the competitors must comply.

BUILDERS' PRICE BOOKS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Having been a subscriber to your valuable journal from its commencement I venture to make the following inquiry: "Which of the builders' price books is the most suitable for use in the provinces? Possibly you would state the relative merits of those in general use, and oblige, yours respectfully,

C. H. H.

Correspondence with several provincial firms has failed to elicit any satisfactory answer to your query. An addition of 10 or 15 per cent. to the p.c. sums in Crosby, Lockwood, and Son's price book would probably be satisfactory for estimating purposes; but your safest course would be to obtain a list of prices from some good builder in the locality for which they are required. A reliable book of prices for the provinces is still a long-felt want in the Profession, and seems likely to remain so.

At a public meeting held at the Eastbourne Town Hall it was resolved to take steps to erect a statue of the late Duke of Devonshire as a local memorial to one who is regarded as "the founder" of Eastbourne.

Trade and Craft.

MESSRS. WEBB AND CO.

Messrs. Webb and Co., makers of plain and encaustic imperishable ceramic tile pavements, &c., have removed from Euston Road to their new warehouses at 68 and 70, Lane Street, Borough, S.E., where all communications should be addressed.

EDINBURGH INFECTIOUS DISEASES HOSPITAL.

The Corporation of the City of Edinburgh is building a new infectious diseases hospital, which, when completed, is expected to be the largest and most perfect of its kind. It is arranged on the pavilion system, and every class of infectious disease is provided for, there being about forty separate blocks, including administrative offices, nurses' home, servants' home, &c. To the sanitary arrangements of every kind the most particular attention is being paid, but more especially is this so with reference to the ventilating and warming, the purposes of the hospital making it absolutely requisite that every provision be made to prevent the spread of infection. The committee, after a careful examination of the various schemes of ventilating and warming—mechanical and natural—applicable to the special requirements, considered that none of them were entirely suitable, and finally decided to have a competition open to all engineers, a premium being offered for the best scheme. Premiated competitions are not unusual for architectural work, but this is a new departure, it being practically the first instance of such a competition for ventilating and warming. The experiment, however, has proved a decided success, a large number of plans having been submitted, under motto, from every part of the Kingdom, some of them of exceptional merit. Finally, however, those of "Reputation" were adjudged the best, and the premium awarded accordingly. We are informed that the winners are a Liverpool firm—Messrs. Dargue, Griffiths and Co., Ltd., 15, Lord Street, Liverpool—who have already been instructed to proceed.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ASHTON-UNDER-LYNE.—Accepted on a schedule of prices for the construction of a sewer in Cavendish-street, for the Corporation. Mr. J. T. Barnshaw, C.E., Town Hall, Ashton-under-Lyne.

R. C. Fish, Ashton-under-Lyne.

BECKENHAM.—For erecting a pair of semi-detached villas, St. James-avenue, Beckenham, for Mr. Bartley. Messrs. F. and W. Stocker, architects, 90, Queen-street. Quantities by Mr. J. J. Pamphill:

George Newton	£2,765	Green	£1,906
Grady	2,549	Watt	1,825
Arnand	2,330	John Appleby	1,798
Jones	2,260	Furness	1,739
Siam and Denton	2,180	Chas. King	1,720
Wills	2,000		

BRIDLINGTON QUAY.—For the erection of eleven houses, near Beckhill, for the Directors of the People's Palace. Mr. W. S. Walker, architect, Central Chambers, Bridlington Quay.

F. Blackburn and Son	£3,069	J. H. Hudson, Brid-
W. Barnes	3,025	lington

COMPETITIONS.

CITY OF WINCHESTER.
TO ARCHITECTS AND SURVEYORS.
The Town Council invite Architects and Surveyors to submit COMPETITIVE PLANS for the ERECTION OF PUBLIC BATHS.

Full particulars, with plan of site, to be obtained, on deposit of One Guinea, on application to the City Surveyor, Guildhall, Winchester, which will be returned on receipt of a bona-fide set of plans.

Premiums of £25 and £15 will be awarded for the designs adjudged by the Council of sufficient merit, and placed first and second in order respectively.

The Premiated Plans will become the property of the Corporation, and the Architect whose plans are selected may be required to carry out the work, in which case the premium will merge into the commission.

Drawing and detailed estimate to be deposited at my Office, marked "Swimming Baths," on or before FEBRUARY 28th, 1898.

WALTER BAILEY,
Town Clerk.

Guilddhall, Winchester,
January 18th, 1898.

EDINBURGH DISTRICT LUNACY BOARD.

PROPOSED ASYLUM AT WEST BANGOUR.
TO ARCHITECTS IN SCOTLAND.

The Board having acquired the Estate of West Bangour situated in the Parish of Ecclesmachan, Linlithgowshire, about two miles west of Uphall, for the purpose of establishing a DISTRICT LUNATIC ASYLUM to accommodate 600 patients, but capable of extension so as ultimately to accommodate 1000 patients, invite all architects in Scotland who are willing to compete, and who have been in practice on their own account for not less than two years, to submit COMPETITIVE DESIGNS for the same.

The conditions of competition may be obtained on application to Mr. ANDREW FERRIER, Clerk to the Edinburgh District Lunacy Board, Parish Council Chambers, Castle Terrace, Edinburgh.

"EMPRESS"
SMOKE
CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney pot.

Full Particulars of Sizes, Prices, &c., on application to the Makers—

EWART & SON.

LONDON N.W.

ESTABLISHED 60 YEARS.

Surveying and Sanitary SUPPLEMENT.

FEBRUARY 2ND, 1898.

POLICE STATIONS AND PRISONS.

By GEORGE H. BIBBY, F.R.I.B.A.

III.—CELL FITTINGS.

(Continued from page xxxviii.)

THE windows for the prisoner's cells should be, in all cases, fixed close to the ceilings, and should be about 3ft. 6in. by 1ft. 6in.

A portion should be constructed so as to open for ventilation. The official requirements render it necessary that the inlet openings for air should be not less than 54in. in area, and that the general arrangement should be similar to that shown in Fig. 4, which gives details of the construction (in plan, section, and elevation) suitable under ordinary circumstances, but it will be seen that the thickness of the walls should be an item for consideration before fixing the exact size of the window openings, for the light to be obtained through a window of the area shown would obviously be very much less where upper floors render it necessary that the cell walls of lower floors should be of considerable thickness.

The outer guard-bars should be constructed so as to throw the light from the sky in a downward direction, and should be of wrought-iron, well built into the walls, and should not be so thick as to materially lessen the daylight openings.

The sash should be of cast-iron and divided into small panes as shown on the elevation. A reference to the section will remind the planner of the window that the positions of the cast-iron sash and the wrought-iron guard bars must be so arranged that broken panes may be removed and new glass introduced when necessary. This might be impossible if the outer bars were placed too near to the sash; from the section it will be seen that the sill should be in one stone, splayed on both exterior and interior sides.

The doors of the cells, and also the frames,

should be of strong construction and lined with sheet iron. An arrangement such as is shown in Fig. 5 appears to be convenient for the purpose and is officially approved, or suggested. These doors may either open inwards to the cell or outwards towards the

passing in rations to the prisoner. The manner in which the door is usually arranged is shown in Fig. 5.

Artificial light, whether gas, electric, or oil lamps be used, must always be placed beyond the control or interference of the prisoners, and, therefore, must be accessible only from the corridors leading to the cells. In Fig. 6 is shown a plan, section, and elevation of a wall case to contain a light, which would serve the double purpose of lighting the corridor as well as the cells.

In the cell passage, or corridor, there might be a tap for cold water and lavatories, but in some cases it may be preferred that basins and water be supplied to the prisoners in their cells.

But in all arrangements for police stations the cells, &c., must be kept quite separate from the apartments used as police residences, and all accommodation for the married constables should be isolated from the quarters assigned to the unmarried officers.

The business apartments of a police station should be closely associated with the cell corridors. There may be, in small police stations, merely a small office, usable as a waiting-room and for general purposes, but in the case of large and important stations there may be necessity for offices for detectives, superintendent, clerks' office, charge room, search and store rooms, &c., parade sheds, stable buildings; all distinct and separate from the police residences.

The earliest prisons of this country (other than those planned within the precincts of baronial castles) were frequently formed in the gate-houses connected with the bars or gates of cities. These were probably in connection with the guard-rooms or apartments used by the officials charged with the duty of keeping the city gates and walls. The origin of Newgate dates from an ancient custom of imprisoning malefactors in the houses adjoining this entrance to the city of London. So long ago as 1218, the gate, on the site of which the present prison partly stands, was used as a place of confinement, and was called the Chamberlain's Gate. In 1412 it was rebuilt

corridor, they must each have a glazed inspection hole, fitted with a movable sliding cover, on the side next to the corridor—if the doors are to open outwards two barrel-bolts should be fixed in addition to a strong iron flush lock, which of course only opens from the outside—below the inspection hole there should be a small opening for the purpose of

FIG. 5.

by the executors of Sir Richard Whittington; his statue, with the traditional cat, remained in a niche until its final demolition. The gate was destroyed in the fire of 1666, and rebuilt (whence its name of "Newgate"), and subsequently demolished to make way for the present prison, which was completed in 1780. A description of one of the wards, as existing more than half a century since, states: "It is a long room, lighted on one side by high, semi-circular windows or fan-lights; against the opposite wall are two rows of sleeping places, one under the other, and bearing some resemblance to the cabin berths of a ship; each was provided with two rugs and a pillow; the only furniture in the room was a long deal table and a couple of forms; a comfortable fire burned in a grate at the end."

At the time the above was written Newgate was no longer specially used as a place of punishment, it was a prison of transit, or jail set apart for the safe custody of untried prisoners whose guilt remained to be proved; of persons, in fact, who, having been examined before the magistrates, have had circumstances of suspicion brought against them sufficiently strong to warrant their being committed to Newgate for trial either at once or

in default of bail. It was therefore considered manifestly unjust to render a residence in Newgate under such circumstances so irksome as to amount to a punishment, over and above the mere confinement, which was a punishment in itself, although not for a very protracted period, inasmuch as the sessions occurred so frequently.

At this period there were in Newgate prison no less than fifteen condemned cells. These were small, narrow pens, scantily lighted by a high and barred window; in one corner a metal wash-basin was fixed to the wall, and there was an iron bed which all but filled the rest of the space. In still more remote times than those now mentioned, each of these dismal cells held four prisoners, all condemned to death and loaded with irons.

The prisoners admitted to Newgate fifty years ago were possibly less cleanly in their habits than the criminals of the present time; at all events, all new comers were even then compelled to use the bath-rooms then provided, and their clothing was disinfected by some baking process, probably similar to that adopted in modern disinfecting chambers. The clothing, however, appears to have frequently suffered under the process to such an extent that the prison authorities found it occasionally necessary to provide new garments.

About forty years since, military prisons were occasionally merely groups of huts, inclosed by high wooden palings, all the supports, etc., being on the outside, the inside being flat and bare of all breaks or projections. These were guarded by chains of sentries inside and out. The prison huts had only one door and a fireplace at the opposite end instead of a stove in the centre, iron stanchions secured all the windows, and the door was fastened with a double lock which could only be fastened or opened from the outside, the warder in charge had a small bunk next the door; the arrangements were such as to make it extremely difficult for a prisoner to escape.

The punishment of long continued solitary confinement was very common in former times, but it is a punishment which no one has a right to inflict upon another, as its results have been disastrous and its tortures very great. At the Spinning House at Cambridge, where there were two cells termed solitary, the keeper declared that he was afraid to confine female prisoners lest they should attempt suicide; and even male prisoners have been known to die, apparently from fright caused by a superstitious dread of solitary confinement. There can be no doubt that long-continued solitary confinement causes a cruel suffering both in body and mind—

"As he passed through Coldbath Fields he looked at a solitary cell, And he was well pleased, for it gave him a hint for improving his prisons in hell!"

Newgate prison was restored by Wren in 1672, after the Great Fire, but it was burnt to the ground in the riots of 1780. The iron bars are said to have been eaten through, and the stones vitrified by the intense heat. On the top of old Newgate was a windmill which was an early attempt to provide ventilation, for about 1770 a contagious disease, then called the "gaol distemper," greatly affected numbers of prisoners, and even carried its contagion into courts of justice, when trials were held; and for this reason this early ventilator was placed in position to expel the foul air, and make way for such fresh air as could be obtained. It is said that during the sessions herbs were spread in the courts of justice and in the corridors adjacent for the purpose of preventing infection. At the present time liquid disinfectants are occasionally used in the London police-courts, and are sprinkled about the floors immediately before the public and prisoners are admitted to the court-rooms.

The prison of Newgate was considered one of the best designs of George Dance. The design certainly has the effect of impressing a sense of great security and solid construction, but it was still unfinished when, in 1780, Newgate was attacked by Lord George Gordon's rioters, who broke open the occupied portion, and set at liberty many prisoners. It was 297ft. in length by 115ft. in breadth, and the outer walls 3ft. in thickness. Years ago

there were, it is said, 800 prisoners confined at one time, and when a severe fever raged the female prisoners (of whom there were more than a hundred) were allowed a sleeping space of only 18in. each in breadth. It was not until about the year 1808 that any whitewashing of the cells was regularly attended to. After this period the cells were whitewashed and cleansed at least twice a year. In later times the prison was reconstructed upon the cellular system, the front portion being finished about forty years ago. In the middle a large central corridor was arranged to occupy the whole length of the structure, and on each side four galleries were planned to communicate with the cells of the prisoners. No fireplaces were placed in the cells, but warming and ventilation was provided for by the admission of fresh air from an altitude of about forty feet, conveyed downwards, and which, passing through a shaft under the building, was arranged to come into contact with a series of pipes heated by steam. This heated air was contrived by a series of flues, so as to pass into each cell by openings, each with an area of about sixty inches; the foul air being conveyed to an upcast shaft provided with steam pipes to rarify the air, and procure the necessary circulation. For the purposes of warming and ventilation, two steam boilers have been provided, each 18ft. long by 5ft. 6in. diameter. The basement of the prison was arranged to contain the reception and punishment cells, bath-rooms, boiler-house, and stores. The building is so isolated that if a prisoner in his attempt to escape gained the roof, he could not possibly get away without the risk of death. Great improvements were effected by the new system adopted, by affording more adequate accommodation for the officers in charge of the inmates, and the provision of airing-courts for the pur-

pose of enabling the prisoners to take outdoor exercise.

It was not until the year 1817 that the treadmill was introduced into English prisons. It appears to have been introduced by a person named Cubitt, an engineer, and was first used at the Brixton Prison.

George Dance also built the City House of Correction in 1791, to take the place of an inferior prison in Wood Street, which adjoined,

FIG 6B. ELEVATION OF GAS BOX TOWARDS GAS CELL.

or was near to Christ's Hospital, and was closed in 1854, since when it has been taken down.

A little later than 1791, the Horsemonger Lane Prison was designed by the celebrated architect, George Gwilt. John Howard, however, is said to have suggested the plan of this prison, which was intended for debtors and criminals.

The cells of the Pentonville Prison, which was commenced in 1840, were 13ft. 6in. long by 7ft. 6in. wide and 9ft. high. These dimensions are rather greater than now considered necessary for police stations, as 13ft. by 7ft. by 9ft. are at present the usual figures. Each

PLAN OF DOOR

FIG. 5B.

cell at Pentonville is said to have cost £180, whereas the cells at Millbank Prison cost no less than at the rate of £500 per cell.

So late as the year 1812 the "New Prison" at Clerkenwell was provided with cells in which the prisoners slept in their rugs upon a boarded floor, even straw being denied them. Straw was allowed at the Coldbath Fields Prison in 1799, but the windows to the cells had no glass in them, merely the usual iron guard-bars.

As the architect of "New Prison" was compelled to raise the ground 7ft. above the original level of the site, it is probable that the locality was damp and very little above flood levels, and therefore especially unsuitable for a habitation for prisoners.

DILAPIDATIONS.*

By PROF. HENRY BUSHELL, F.S.I.

(Continued from page xliii.)

THE meaning of to "substantially repair," &c., was explained in *Monk v. Noyes*, wherein the tenant was held responsible for keeping up the internal painting. *Harris v. Jones* is a prominent case in regard to the value of the phrase "in good substantial repair and condition." This was an action brought in 1832 by the lessor against lessee on a covenant to repair contained in a lease, by which plaintiff demised a messuage to the defendant for six years from Michaelmas, 1824, at fifty guineas per annum. The covenant was to well and sufficiently repair, uphold, &c., &c., and keep the premises, &c., and should and would deliver up, &c., "in good substantial repair and condition." There was also a specific covenant to paint externally every third year, and internally every fifth year. Chief Justice Tindal regarded the words to imply that the covenants were to be substantially complied with, for that in cases of this nature it was hardly to be expected that a strict and literal performance of so general a covenant (unless where the language pointed to any particular matter) could be proved. The defendant was only bound to keep up the house as an old house, not to give the plaintiff

THE BENEFIT OF NEW WORK;

and upon the whole the jury were to say whether the particulars of non-repair enumerated by plaintiff's witnesses were dilapidations amounting to a substantial breach of the covenants; as to the other breach of covenant (for not painting the inside in the fifth year), the plaintiff was entitled to nominal damages. A verdict was given for defendant. A rule nisi was obtained for a new trial, but the rule was discharged. This important case establishes the precedent that a general covenant to repair is satisfied by the lessee keeping the premises in substantial repair; a literal performance of the covenant is not to be required. In the earlier portion of my paper I have referred generally to the mitigating effect which certain circumstances have in regard to dilapidations, which by some practitioners are underrated or disregarded when making the claim. It is well established that where a lessee covenants to keep old premises in repair, he is not liable for such dilapidations as result from "the natural operation of time and the elements." The case of *Gutteridge v. Munyard* (1834) is quoted as an authority by most of the text-books, and was cited in my previous paper. I trust you will, however, permit me to give one extract from the summing-up of Chief Justice Tindal, wherein he states: "That where a very old building is demised and the lessee enters into a covenant to repair, it is not meant that the old building is to be restored in a renewed form at the end of the year, or of greater value than it was at the commencement of the term.

* A paper entitled "The Practical Application of the Principles and Law of Dilapidations," read before the Auctioneers' Institute.

What the natural operation of time flowing on effects, and all that the elements bring about in diminishing the value, constitute a loss which, so far as it results from time and nature, falls on the landlord." I think that this aptly illustrates what is embraced by the effect of "the natural operation of time and the elements," and which is essentially a question for the surveyor to determine. This being so, it resolves itself into a question of opinion or expert evidence to be given by surveyors on the one side, or the other. In intimate relationship with the foregoing may be considered the different expressions of "wear and tear," or "use and wear," which should be worked out upon similar lines, and which crop up in some of the cases already quoted. I think that to the surveyor it should suggest a reasonable interpretation. How? Again I submit that he must realise what would be the result of a proper use and occupancy of the demised premises for a given period and for a specific purpose; in other words,

WHAT IS THE PROPER DEPRECIATION

in view of the circumstances? The relationship between lessee and under-lessee in the matter of covenants to repair, demand our careful discrimination. Covenants to repair inserted in an under-lease, although worded precisely the same as in the original lease, must be interpreted differently in point of degree, on account of the more recent date of the under-lease. It will, therefore, invariably be incumbent on the surveyor to decide in what degree, or to what extent, the under-lessee's liability differs from that of the lessee's. The Courts have well decided that, although the covenants are the same in language, if there be a sufficient interval of time between the lease and the under-lease then they may be substantially different in degree; therefore, in considering a general covenant to repair, due regard must be had to the age and condition of the premises at the time when the particular covenant begins to operate. An excellent case in illustration of this is *Walker v. Hatton*, tried in 1842. In my former paper, read before the Auctioneers' Institute, I explained, by way of illustration with some amount of detail, at least many of the leading items of dilapidations likely to be met with in ordinary or domestic buildings. That, I trust, will be sufficient apology for my treating now only two or three questions arising out of liability to repair.

REGARDING ORIGINAL FAULTY CONSTRUCTION

it appears to me to be iniquitous that a lessee, under any ordinary circumstances, should be responsible for defects of such a serious nature, although he is supposed to treat for the property with his eyes open.

(To be continued.)

THE Local Government Board has approved of the plans of the Milton Valley water scheme for the supply of Pembroke Dock and the Government Dockyard, and authorising the Council to borrow £23,000 for the purpose of carrying out the works in connection with the same.
